CLASSIFICATION CONFIDENCE LEVEL 1

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is uncommon, mostly found in the central and southwestern portions of the park.

Globally

This community is found in northeastern Minnesota, northern Michigan, northwestern Ontario, and southeastern Manitoba. It may be found in other parts of Manitoba.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occurs on gentle to moderate slopes of ridges, usually at elevations of about 630 to 790 feet, on well-drained to rapidly-drained, organic or sandy soils.

Globally

This community is found on level to gently sloping ground. Soils are typically moderately well drained, coarse loams, sands, and silts (Sims et al. 1989).

Globally

Picea mariana, Pleurozium schreberi

VEGETATION DESCRIPTION

Isle Royale National Park

This black spruce/feathermoss forest is a closed canopy evergreen forest with 60 to 90% canopy cover. *Picea mariana* is the most abundant canopy tree; *Pinus banksiana* is rare or absent; the feathermoss *Pleurozium schreberi* is common in the groundlayer (average 38% cover); characteristic herbs are *Aster macrophyllus* and *Cornus canadensis*.

Globally

The canopy of this community is closed and strongly dominated by *Picea mariana* with small amounts of *Abies balsamea*, *Betula papyrifera*, *Picea glauca*, *Pinus banksiana*, and *Populus tremuloides*. The shrub and herb layer are poorly developed (Grigal and Ohmann 1975). Species that are most abundant in these layers include the shrubs *Corylus cornuta*, *Gaultheria*

Isle Royale National Park

procumbens, Ledum groenlandicum, Rosa acicularis, Vaccinium angustifolium, and Vaccinium myrtilloides, and the herbs Aster macrophyllus, Cornus canadensis, Equisetum arvense, and Maianthemum canadense. Feathermosses, particularly Pleurozium schreberi, are very abundant. Mosses may cover from 23 % (Grigal and Ohmann 1975) to over 85% (Sims et al. 1989) of the forest floor.

RANGE

Isle Royale National Park

This community is uncommon; it is found primarily in the central portions of the island near the southeast-facing Lake Superior shore.

Globally

This community is found in northeastern Minnesota, northern Michigan, northwestern Ontario, and southeastern Manitoba.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies moderate to somewhat steep, southeast-facing slopes at elevations from 620 to 730 feet. Soils are sandy loams that are well-drained to rapidly drained.

Globally

This community is found on flat areas and gentle upper and lower slopes but not on ridges or valley floors (Ohmann and Ream 1971). Soils are moderately deep (60-80 cm) sands, coarse loams, or silts with boulders often present at or near the surface (Ohmann and Ream 1971, Sims *et al.* 1989).

VEGETATION DESCRIPTION

Isle Royale National Park

This jack pine - black spruce forest type is a somewhat open canopy, evergreen forest with about 60% canopy cover. Pinus banksiana and Picea mariana are codominant in the canopy; the most abundant shrubs are Vaccinium angustifolium, Rubus parviflorus, Lonicera canadensis, and Arctostaphylos uva-ursi. The most abundant herbs are Aster macrophyllus and Maianthemum canadense. In the moss layer, the feathermoss Pleurozium schreberi is common (average 18% cover).

Isle Royale National Park

Globally

The tree canopy is usually dominated by *Pinus banksiana*, but this species may have little successful reproduction in lower strata. *Picea mariana* is of secondary importance in the canopy but often the most abundant tree species in the lower strata (Grigal and Ohmann 1975). Other trees found in this community include *Abies balsamea*, *Acer rubrum*, *Picea glauca*, and *Populus tremuloides*. Tall and low shrubs are moderately common whereas herbaceous species are infrequent. Common shrubs include both the tall shrubs *Alnus viridis*, *Amelanchier* spp., and *Corylus cornuta*, and the low shrubs *Diervilla lonicera*, *Gaultheria procumbens*, *Vaccinium angustifolium*, and *Vaccinium myrtilloides*. Herbaceous species include *Aster macrophyllus*, *Clintonia borealis*, *Cornus canadensis*, and *Maianthemum canadense*. Mosses, especially *Pleurozium schreberi*, are abundant, and Grigal and Ohmann (1975) found that *Pleurozium schreberi* had 41% ground cover in 10 stands in northeastern Minnesota, whereas all herbaceous species had 11% coverage.

RANGE

Isle Royale National Park

This community is uncommon, and widely scattered throughout the park.

Globally

This community is found in northern Minnesota, northern Wisconsin, northern Michigan, and northwestern Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies gentle to steep slopes at elevations from 620 to 910 feet. Soils are usually sandy loams.

Globally

This community is found on gentle wet-mesic slopes to very steep well-drained slopes (MN NHP 1993). The predominant aspect is north to northeast. Soils are moderately deep to deep (50-100 cm), calcareous, coarse to fine textured, and often contain boulders at the surface (Ohmann and Ream 1971, Sims *et al.* 1989).

Globally

Thuja occidentalis, Abies balsamea, Acer spicatum, Coptis trifolia

VEGETATION DESCRIPTION

Isle Royale National Park

This white cedar mesic forest is an evergreen forest with a variable canopy cover ranging from 50 to 90% cover. *Thuja occidentalis* is the most abundant canopy tree; *Abies balsamea* and *Betula papyrifera* are common associates. Cover of short shrubs varies from 0 to 60%; the most abundant shrubs are *Rubus parviflorus* (25 to 50% cover), *Rubus pubescens* and *Diervilla lonicera*. Herbaceous cover varies from 20 to 70%; the most abundant herbs are *Aralia nudicaulis*, *Lycopodium annotinum*, *Streptopus roseus*, and *Cornus canadensis*.

Globally

The overstory is dominated by coniferous trees, with or without a substantial deciduous component. *Thuja occidentalis* is the most abundant tree and may occur in pure stands. Usually there are other canopy species, especially *Abies balsamea*, *Betula papyrifera, Picea glauca, Picea mariana, Populus tremuloides*, and *Pinus strobus*. There is usually an abundant shrub/sapling layer with saplings of *Thuja occidentalis* and *Abies balsamea* along with the shrubs *Acer spicatum, Corylus cornuta, Linnaea borealis*, *Lonicera canadensis*, *Rubus pubescens*, and *Sorbus decora*. The ground layer is typically diverse on mesic to wet-mesic

Isle Royale National Park

stands and less so on steep drier stands. Wet-mesic stands can contain a hummock and hollow topography, with a seasonally saturated hydrology. Typical species include Aralia nudicaulis, Aster macrophyllus, Clintonia borealis, Coptis trifolia, Cornus canadensis, Dryopteris carthusiana, Galium triflorum, Maianthemum canadense, Mitella nuda, and Trientalis borealis. Mosses include Drepanocladus uncinatus, Hylocomium splendens, Plagiomnium cuspidatum, Pleurozium schreberi, Ptilium crista-castrensis, and Rhytidiadelphus triquestrus and, in wetter phases of the type, Sphagnum spp (Ohmann and Ream 1971, Sims et al. 1989, Chambers et al. 1997).

CLASSIFICATION CONFIDENCE LEVEL 2 USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community occurs throughout the park, most often at low elevations near the Lake Superior shore.

Globally

This association is found in Manitoba, Ontario, and northern Michigan.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies upland slopes and flats, often on low slopes near Lake Superior, but also on middle slopes of ridges; elevations range from 604 to 870 feet. Soils are often sandy loam or loam.

Globally

Stands occur on fresh, well-drained upland mineral soils (Sims *et al.* 1989). In the U.S., they may be restricted to the coldest, north-facing slopes, such as those found on north slopes of islands in Lake Superior (Suzie Islands, Isle Royale).

Globally

Picea glauca, Abies balsamea, Pleurozium schreberi

VEGETATION DESCRIPTION

Isle Royale National Park

This spruce - fir / feathermoss forest has a variable physiognomy, ranging from open canopy evergreen woodlands to closed canopy evergreen forests. The most abundant canopy trees are either *Abies balsamea* (typically 3 to 38% cover) or *Picea glauca* (typically 15 to 38% cover). In areas heavily browsed by moose, such as at the west end near Windigo, *Abies* may be completely absent from the canopy, and only present in the shrub layer as browsed scrub (typically with 1 to 7% cover). *Betula papyrifera* is often present, with a low cover (typically 3 to 15% cover). Other trees infrequent in the canopy include *Picea mariana* and *Thuja occidentalis*. This forest community usually has 60 to 80% canopy cover, but on Isle Royale in areas with heavy moose browse, the canopy can be much more open, with as little as 30% cover. The

USGS-NPS Vegetation Mapping Program Isle Royale National Park

more open stands usually have a higher cover of short or browsed *Abies* (1 to 5 m tall). The cover of shrubs is quite variable, from few shrubs to over 50% cover. The most abundant shrubs are *Abies balsamea*, *Rubus parviflorus*, *Viburnum edule*, and at the extreme northeast end of Isle Royale NP, *Oplopanax horridus*. The most abundant herbs are *Cornus canadensis*, *Aralia nudicaulis*, *Aster macrophyllus*, *Clintonia borealis*, *Gymnocarpium dryopteris*, *Linnaea borealis*, and *Mitella nuda*. Feathermosses such as *Pleurozium schreberi* and *Hylocomium splendens* are common in the groundlayer. Tree branches are often draped with beard lichens such as *Usnea* spp.

There is an uncommon variant of this association found mostly on the northeast end of the park, the *Abies balsamea | Taxus canadensis – Oplopanax horridus* variant, which has a tree canopy with 70 to 90% cover. *Abies balsamea* is the single most abundant canopy tree. Cover of short shrubs varies from 40 to 80%. *Taxus canadensis* and *Oplopanax horridus* are the most abundant shrubs. Herbaceous cover varies from 20 to 70%. The most abundant herbs are *Clintonia borealis*, *Dryopteris expansa*, *Linnaea borealis*, *Maianthemum canadense*, and *Mitella nuda*. Cover of nonvascular plants varies from 30 to 80%; the feathermoss *Pleurozium schreberi* is abundant in the groundlayer.

Globally

Stands are dominated by *Picea glauca* and *Abies balsamea*. Associates can include *Picea mariana*. The shrub and herb layer are species poor or of low cover. Shrubs include *Abies balsamea*, *Amelanchier* spp., *Diervilla lonicera*, *Linnaea borealis*, and *Rubus pubescens*. Herbs include *Aralia nudicaulis*, *Clintonia borealis*, *Coptis trifolia*, *Cornus canadensis*, *Mitella nuda*, *Streptopus roseus*, *Trientalis borealis*, and *Viola renifolia*. Mosses dominate the ground layer, including extensive mats of feathermosses, such as *Pleurozium schreberi*, *Ptilium crista-castrensis*, *Hylocomium splendens*, and *Rhytidiadelphus triquetrus* (Sims *et al.* 1989).

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is rare and scattered, it was sampled at two sites: at the east end of Lake Halloran (southwest end of the park), and on Amygdaloid Island (northeast end of the park).

Globally

This community is found in northern Minnesota, northern Michigan, northwestern Ontario, and southeastern Manitoba.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions with a gentle slope facing southeast or southwest at elevations ranging from 620 to 662 feet. Soils are saturated peats.

Globally

This type occurs as part of large peatlands, in confined basins and along the upland margins of less minerotrophic peatlands (Harris *et al.* 1996). Stands occur on level, wet, poorly drained organic soils (Zoladeski 1995). The substrate is deep, fibric Sphagnum peat or shallow peat over clay. Hummock and hollow microtopography is moderately to well developed with standing water occasionally occurring in the hollows. The water regime is saturated.

VEGETATION DESCRIPTION

Isle Royale National Park

The black spruce/alder rich swamp is an open canopy, evergreen, wooded wetland. The tree canopy (over 5 m tall) is sparse, with 10 to 20% cover; the same species are present in the tall shrub layer (2 to 5 m tall) with 30 to 40% cover. *Picea mariana* and *Picea glauca* are the most abundant trees, each with 5 to 25% cover. *Alnus incana* is the most abundant

Isle Royale National Park

tall shrub, with 20 to 40% cover; other tall shrubs include *Picea mariana*, and *Larix laricina*, each with 5 to 25% cover. Short shrub and dwarf shrub layers are very sparse, with less than 10% cover. There is 70 to 80% herbaceous cover; the most abundant herbs are *Carex rostrata*, *Calamagrostis canadensis*, *Iris versicolor*, *Impatiens capensis*, and *Aster puniceus*. *Sphagnum* spp. (including *Sphagnum magellanicum*) and *Calliergon* spp. are the most abundant mosses, with 5 to 25% cover. *Usnea* spp. are the most abundant lichens.

Globally

The overstory is composed almost exclusively of conifers. *Picea mariana* is the most abundant tree and may occur in pure stands. *Abies balsamea, Larix laricina*, and *Thuja occidentalis* vary from minor to codominant. There is a moderately well developed tall shrub/sapling layer, consisting of *Alnus incana* and saplings of the canopy trees. Several shrubs, many of them ericaceous, make up a low shrub layer. These include *Andromeda polifolia, Chamaedaphne calyculata, Gaultheria hispidula, Ledum groenlandicum, Linnaea borealis, Rubus pubescens*, and *Vaccinium angustifolium*. The herbaceous layer is frequently species rich, containing species such as *Calamagrostis canadensis, Carex leptalea, Carex trisperma, Clintonia borealis, Coptis trifolia, Cornus canadensis, Dryopteris cristata, Eriophorum* spp., *Mitella nuda*, and *Trientalis borealis*. Mosses include *Dicranum flagellare, Dicranum polysetum, Pleurozium schreberi, Ptilium crista-castrensis, Sphagnum girgensohnii, Sphagnum magellanicum*, and *Sphagnum nemoreum* (Sims *et al.* 1989, Harris *et al.* 1996, Chambers *et al.* 1997).

RANGE

Isle Royale National Park

This community is uncommon, and scattered throughout the park.

Globally

This community is found in northern Michigan, northwestern Ontario, northern Minnesota, northern Wisconsin, and southeastern Manitoba. This community is rare in Michigan.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions at elevations ranging from 610 feet (just a few feet above Lake Superior lake level) to 990 feet. Soils are saturated peat or muck.

Globally

This type is found in confined peatland basins, on the upland margins of large peatlands, in poorly drained depressions in bedrock, and removed from the water's edge on peatland shorelines (Harris *et al.* 1996). Stands occur on level, wet sites with organic soils (Zoladeski *et al.* 1995). The substrate is deep, acidic Sphagnum peat that is mineral poor (Kurmis *et al.* 1986). Hummock and hollow microtopography is moderately to well developed. The water regime is saturated.

CHARACTERISTIC SPECIES

Isle Royale National Park

Picea mariana, Ledum groenlandicum, Carex trisperma

Globally

Picea mariana, Ledum groenlandicum, Carex trisperma, Sphagnum spp.

VEGETATION DESCRIPTION

Isle Royale National Park

This black spruce poor swamp is an open canopy, evergreen wooded swamp, typically with 20 to 50% cover of trees over 5 m tall. *Picea mariana* (with 25 to 50% cover), *Larix laricina* (with 1 to 5% cover), and *Betula papyrifera* (1 to 5% cover) are the most abundant trees. Cover of tall shrubs varies from about 5 to 30%; the most abundant tall shrubs are *Picea mariana* (1 to 25% cover) and *Larix laricina* (0 to 5% cover). Cover of short shrubs is variable, ranging from 5 to 90%. The most abundant short shrubs (including dwarf shrubs) are *Chamaedaphne calyculata* (5 to 90% cover), *Ledum*

Isle Royale National Park

groenlandicum (5 to 25% cover), and Abies balsamea (0 to 25% cover). Herb cover varies from about 20 to 70%. The most common herbs are Carex oligosperma, Carex trisperma, Calamagrostis canadensis, Maianthemum trifolia, Sarracenia purpurea, and Symplocarpus foetidus. Cover of Sphagnum spp. ranges from 5 to 90%.

Globally

The overstory of this community is dominated by conifers. The tree canopy is broken to closed over a moderately well developed low shrub layer, sparse herbaceous layer, and a carpet of mosses (Kurmis et al. 1986). The canopy is often pure Picea mariana, but Larix laricina may be a codominat. Abies balsamea can be present to codominant, and the occasional Pinus banksiana may occur (Sims et al. 1989). The shrubs are primarily ericaceous and include Chamaedaphne calyculata, Gaultheria hispidula, Kalmia polifolia, Ledum groenlandicum, and Vaccinium spp, but mixed spruce-tamarack stands can contain Alnus incana or Betula glandulosa. The few herbaceous species found in this community include Carex lasiocarpa, Carex trisperma, Clintonia borealis, Coptis trifolia, Cornus canadensis, and Maianthemum trifolium. Occasional minerotrophic indicators found in northern Minnesota include Carex lacustris, Iris versicolor and Monotropa uniflora (M. Smith personal communication 1999). Mosses, particularly Sphagnum spp. typically cover nearly 100% of the forest floor. Dicranum polysetum, Sphagnum spp. (including Sphagnum magellanicum, Sphagnum recurvum sensu lato, Sphagnum capillifolium, Sphagnum russovii), and Pleurozium schreberi are among the species found in this abundant moss layer (Sims et al. 1989, Harris et al. 1996).

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is common and widespread throughout the park.

This community is found in northern Minnesota, northern Wisconsin, Upper and Lower Michigan, southeastern Manitoba, and northwestern Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions that are either flat or have a gentle slope, at elevations ranging from about 605 to 1000 feet. Soils are peat or muck, poorly to very poorly drained, and saturated to seasonally flooded.

Globally

This community is found on level to gently sloping ground with wet, organic (Sims et al. 1989) or mineral soil (MN NHP 1993). Stands typically occur along the margins of peatlands, in drainage courses, or shallow depressions. The substrate has moderately minerotrophic conditions over deep peat. Hummock and hollow microtopography is usually well developed. In wetter stands, there is often standing water present in the hollows. Coarse woody debris can be significant. The water regime is saturated.

Schwintzer and Tomberlin (1982) reported detailed results on the chemical characteristics of the ground water of several wetland types in Lower Michigan. They found that it was difficult to differentiate swamps dominated by conifers from those dominated by other vegetation on the basis of ground water. The swamps were moderately to strongly minerotrophic and had circumneutral pH.

CHARACTERISTIC SPECIES

Isle Royale National Park

Thuja occidentalis, Alnus incana, Symplocarpus foetidus

Globally

Thuja occidentalis, Alnus incana, Coptis trifolia, Carex disperma, Hylocomium splendens, Sphagnum spp.

VEGETATION DESCRIPTION

Isle Royale National Park

At Isle Royale NP, this white cedar -(mixed conifer) swamp is a wooded wetland that has variable canopy cover, ranging from 25 to 90%. Thuja occidentalis is the most abundant canopy tree (average 30% cover); Larix laricina and Picea mariana may also be common. The tall shrub layer varies from 5 to 70% cover; Alnus incana is the most abundant tall shrub (average 26% cover). Saplings of Thuja occidentalis and Picea mariana are also common in tall or short shrub layers. The short shrub layer usually varies from 5 to 30% cover; Ledum groenlandicum, and Rhamnus alnifolia are characteristic shrubs. Cover of herbs is usually from 50 to 80%; the most abundant herbs are Symplocarpus foetidus, Calamagrostis canadensis, and Carex stricta. Other characteristic herbs include Cornus canadensis, Carex trisperma, Iris versicolor, Coptis trifolia, Mitella nuda, Maianthemum trifolium, Menyanthes trifoliata, Linnaea borealis, Clintonia borealis, Trientalis borealis, Viola renifolia, Caltha palustris, and Glyceria striata. Nonvascular cover varies from 5 to 80%. The most abundant mosses are Sphagnum spp.

Globally

The canopy is often moderately dense to dense (MN NHP 1993). Basal areas of 42.2-62.2 m²/ha and densities of 2457-7565 stems/ha have been reported in four stands in Lower Michigan, using a tree definition of woody stems greater than 2.5 cm dbh (Schwintzer 1981). The understory structure consists of high hummocks and deep, water-filled hollows, with fallen, moss-covered logs common. Thuja occidentalis is usually moderately to strongly dominant in the canopy, but occasionally Picea mariana may overtop the subdominant Thuja occidentalis. Other species include Abies balsamea, Acer rubrum, Betula papyrifera, Fraxinus nigra, Larix laricina and, more rarely, Picea glauca (in northern Minnesota and northwestern Ontario), or Tsuga canadensis (eastward). The shrub layer in this community is sparse to dense, in inverse proportion to the tree canopy. Species present in this stratum include Alnus incana, Chamaedaphne calyculata, Cornus sericea, Gaultheria hispidula, Ledum groenlandicum, Linnaea borealis, Rosa acicularis, Rubus pubescens, and Vaccinium myrtilloides. Nemopanthus mucronatum and Viburnum cassinoides are more common eastward. Species diversity in the herbaceous layer can be very high. The most common species are Carex spp. (including Carex disperma, Carex leptalea), Coptis trifolia, Cornus canadensis, Clintonia borealis, Dryopteris carthusiana, Galium triflorum, Maianthemum canadense, Mitella nuda, Trientalis borealis, and Viola renifolia. Mosses include Hylocomium splendens, Pleurozium schreberi, Ptilium crista-castrensis, Rhytidiadelphus triquetrus, Sphagnum capillifolium, Sphagnum girgensohnii, and Sphagnum magellanicum. Moss cover may be thin where the canopy is very dense. Diagnostic species include Thuja occidentalis as a dominant/co-dominant species, with a combination of acidic and minerotrophic understory species, such as Alnus incana and Cornus sericea. (Sims et al. 1989, Harris et al. 1996, Chambers et al. 1997).

COMMENTS

Isle Royale National Park

At Isle Royale NP this community has a variable physiognomy, occurring as either a woodland (25 to 60% canopy cover) or a forest (60 to 100% canopy cover).

Globally

Tipup mounds caused by blowdowns are common, in part because the very wet soils permit only shallow rooting by *Thuja occidentalis*.

RANGE

Isle Royale National Park

This community is rare; it seems to be restricted to the southwest end of the island on Red Oak Ridge.

Globally

This association is found in Wisconsin, Minnesota, Michigan, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies somewhat steep to steep, south- to southeast-facing slopes at elevations from 1200 to 1300 feet. Soils are rapidly drained sandy loams. Landscape position is a high slope of a ridge.

Globally

Stands are found on dry to dry-mesic ridge tops and upper- to midslopes, occasionally with bedrock outcrops. Soils are moderately shallow (30-60 cm) to deep, varying from fine sands to loams and clay loams (Chambers *et al.* 1997, especially ecosites 23.1 and 23.2). In central Ontario, stands typically occur on mid- to uppper slopes of morainal landforms, with some stands on lower, very moist soils. Soil depths range from shallow (<30 cm) to deep (over 60 cm).

VEGETATION DESCRIPTION

Isle Royale National Park

This red oak - sugar maple forest is a closed canopy, deciduous forest. Canopy cover varies from 30 to 70%. *Quercus rubra* is codominant with *Acer saccharum*; other tree species present at less than 10% cover include *Acer rubrum*, *Thuja occidentalis*, *Picea glauca*, *Sorbus decora*, and *Pinus strobus*. Tall shrubs vary from 0 to 30% cover, and cover of short shrubs varies from 10 to 70%. The most abundant shrubs are *Juniperus communis* and *Amelanchier* spp. Cover of herbs is from 30 to 40%. The most abundant herbs are *Aralia nudicaulis*, *Calystegia spithamea*, and *Elymus* sp. Cover of nonvascular plants

Isle Royale National Park

is about 10 to 20%. Characteristic nonvascular plants are the moss *Leucobryum glaucum* and reindeer lichens (*Cladina* spp.).

Globally

The canopy is dominated by deciduous trees. Dominant tree species include Quercus rubra, Acer saccharum, and Acer rubrum. Associates include Betula papyrifera, Pinus strobus, Populus grandidentata, and, in the eastern part of its range, Fagus grandifolia, Fraxinus americana, and Ostrya virginiana. Subcanopy species typically include Acer rubrum and Acer saccharum. Shrubs include Amelanchier laevis, Acer pensylvanicum, Corylus cornuta, and Lonicera canadensis. Herbs include Aralia nudicaulis, Aster macrophyllus, Dryopteris carthusiana, Maianthemum canadense, Mitchella repens (a creeping semi-shrub), Polygonatum pubescens, and Pteridium aquilinum. Diagnostic species include Quercus rubra with groundlayer species typical of the mixed hardwood/conifer region (Chambers et al. 1997).

VEGETATION DESCRIPTION

Isle Royale National Park

This sugar maple - yellow birch - northern hardwoods forest is a closed canopy, deciduous forest. Canopy cover varies from 60 to 80%. Canopy dominants are *Acer saccharum* and *Betula alleghaniensis* (their combined cover is over 50%); other tree species present include *Thuja occidentalis*, *Pinus strobus* and *Picea glauca* (each with less than 50% cover). Subcanopy cover varies from 0 to 60% cover. Tall shrub cover is sparse to absent (0 to 10% cover). Cover of short shrubs usually varies from 10 to 40%. *Corylus cornuta* has less than 50% cover in the understory (typical is less than 30%). There is often a fairly high cover of seedlings of *Acer saccharum*. Herbaceous cover is sparse (0 to 5% cover); the most abundant herbs are *Lycopodium annotinum* and *Lycopodium dendroideum*.

Isle Rovale National Park

Globally

This forest community is dominated by deciduous trees with scattered conifers in some stands. Acer saccharum is a dominant throughout the range of this community. It may form nearly pure stands (Flaccus and Ohmann 1964, Hansen et al. 1973). Other common canopy trees include Acer rubrum, Betula alleghaniensis, Fraxinus americana, and Tilia americana. Conifers such as Abies balsamea, Picea glauca, Thuja occidentalis, and Tsuga canadensis can be found in some stands. The shrub layer is sparse, however it can be moderately developed where the tree canopy is not fully closed. Typical shrubs include Acer spicatum, Corylus cornuta, Lonicera canadensis, and Taxus canadensis. The herbaceous stratum includes Clintonia borealis, Lycopodium spp., Maianthemum canadense, Osmorbiza claytoni, Streptopus roseus, and Viola spp. (Chambers et al. 1997).

OTHER NOTEWORTHY SPECIES

Isle Royale National Park

Information not available.

CONSERVATION RANK G3G4. There are probably over 100 occurrences rangewide. Ninety have been documented: 77 in Minnesota (where the community is ranked S2), 10 in Wisconsin (S4), and 3 in Michigan (S4). Although no other occurrences have been documented, the community is also reported from Ontario (S?). The 90 occurrences total 13,401 acres.

Betula papyrifera, Diervilla lonicera, Aster macrophyllus, Aralia nudicaulis

VEGETATION DESCRIPTION

Isle Royale National Park

This paper birch forest is a successional, deciduous forest with a variable physiognomy ranging from open canopy woodlands to closed canopy forest. Canopy cover varies from 60 to 80%. *Betula papyrifera* is the only dominant tree, 50 to 75% cover); *Picea glauca* is often present at less than 5% cover. Cover of tall shrubs varies from 0 to 40%; the most common tall shrubs are *Abies balsamea*, *Corylus cornuta*, and *Picea glauca*, although *A. balsamea* is uncommon in the area burned in 1936. Cover of short shrubs varies from 5 to 80% cover; the most abundant short shrubs are *Rubus parviflorus* and *Diervilla lonicera*, and seedlings, saplings, or browsed scrub of *Abies balsamea*. Herbaceous cover varies from 40 to 80% cover; the most abundant herbs are *Aster macrophyllus* (25 to 50% cover) and *Aralia nudicaulis* (5 to 25% cover).

Isle Royale National Park

Globally

The canopy of this forested community is closed to moderately open. Betula papyrifera is the dominant canopy tree and can form nearly pure stands. Populus tremuloides, Abies balsamea, Picea glauca, and, especially in Canada, Pinus banksiana can be found in minor amounts, as well. Tree density can be high, but the growth form and size of the canopy dominants allows significant light to pass through. Abies balsamea is common to dense in the understory (Hansen et al. 1971) and shrubs such as Corylus cornuta, Diervilla lonicera, Rosa acicularis, and Taxus canadensis. The herbaceous layer is similar to other dry-mesic to mesic northern communities. Species found in this layer include Aralia nudicaulis, Aster macrophyllus, Clintonia borealis, Cornus canadensis, Maianthemum canadense, and Trientalis borealis.

DATABASE CODE CEGL002463

MAP UNITS 53

COMMENTS

Isle Royale National Park

This successional forest is characteristic of burned sites.

Globally

This type often originates after fires. In the absence of disturbance the community may succeed to *Picea glauca - Abies balsamea* evergreen or mixed evergreen-deciduous community types (MN NHP 1993). Further north in Canada, it may succeed to *Pinus banksiana* and *Picea mariana* upland forests (Sims et al 1989). Paper birch has tiny, light-winged seeds, easily blown long distances by wind. Its bark is very flammable, and even ground fires may kill a mature stem. Birch can resprout from the root collar at the base of the trunk, but not from roots further away from the tree (Heinselman 1996).

ALLIANCE POPULUS TREMULOIDES - BETULA PAPYRIFERA FOREST ALLIANCE

CLASSIFICATION CONFIDENCE LEVEL

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is common and widespread throughout the park.

Globally

This community is found in Manitoba, Ontario, northern Minnesota, northern Wisconsin, and Michigan.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies gentle to steep slopes of ridges at elevations ranging from 630 to 960 feet. Soils are silt loams and sandy loams, usually well-drained.

Globally

This community is found on a variety of topographic positions. Omann and Ream (1971) found it on ridgetops, upper, mid, and lower slopes. These slopes are gentle to moderate. The soils are deep, well drained to rapidly drained mineral soils (Sims *et al.* 1989). The soils are usually loam but can be clay, silt, or sand.

VEGETATION DESCRIPTION

Isle Royale National Park

The aspen - birch / boreal conifer forest is a successional, deciduous forest with a variable physiognomy ranging from open canopy woodlands to closed canopy forests. Canopy cover varies from 40 to 100% cover; *Populus tremuloides* (25 to 50% cover) and *Betula papyrifera* (5 to 25% cover) are the most abundant canopy trees. *Picea glauca, Abies balsamea*, and *Thuja occidentalis* are present as subcanopy trees, saplings, or seedlings. *Abies balsamea* is uncommon in the area burned in the 1936 fire. This is a successional forest that seems most likely to develop into a mixed or evergreen forest type. Cover of subcanopy trees varies from 10 to 70%, the most abundant subcanopy tree is *Picea glauca*. Cover of tall shrubs varies from 20 to 60%; the most abundant tall shrubs are *Abies balsamea*, *Picea glauca*, and *Corylus cornuta*. Cover of short

Isle Royale National Park

shrubs varies from 5 to 50%; the most abundant short shrubs are *Abies balsamea*, *Rubus parviflorus*, and *Populus tremuloides*. Cover of dwarf shrubs varies from 5 to 40%, most abundant are *Abies balsamea* and *Diervilla lonicera*. Cover of herbs varies from 20 to 90%; the most abundant herbs are *Aster macrophyllus* (25 to 50% cover) and *Aralia nudicaulis* (5 to 25% cover). Cover of mosses and lichens varies from 5 to 30%.

Globally

This community is dominated by deciduous trees, with a moderate amount of conifers (<25%). The dominant tree species do not have dense leaf layers and allow a significant amount of light to pass through. This promotes the establishment of prominent sapling and shrub layers and a moderately dense herbaceous stratum. The canopy is dominated by Betula papyrifera and Populus tremuloides, and occasionally Populus grandidentata. Conifer associates include Abies balsamea and Picea glauca, either in the canopy or, more characteristically, in the subcanopy. Abies balsamea and Picea glauca are abundant in the sapling layer. Common shrubs include Acer spicatum, Corylus cornuta, Diervilla lonicera, Linnaea borealis, Lonicera canadensis, Rosa acicularis, Rubus pubescens, Sorbus decora, and Vaccinium myrtilloides. The herbaceous stratum is sometimes dominated by Aster macrophyllus, but can include a diversity of forbs, such as Anemone quinquifolia, Aralia nudicaulis, Clintonia borealis, Cornus canadensis, Galium triflorum, Maianthemum canadense, Mitella nuda, Pteridium aquilinum, Streptopus roseus, Trientalis borealis, and Viola renifolia. Mosses include Plagiomnium cuspidatum, Pleurozium schreberi, Ptilium crista-castrensis, and Rhytidiadelphus triquestris (Sims et al. 1989, Chambers et al. 1997). Diagnostic features of this type are the dominance by both Populus tremuloides and Betula papyrifera, boreal conifer associates (but very little Picea mariana or Pinus banksiana), and lack of more southern hardwoods (such as Acer saccharum).

COMMENTS

Globally

Historically, this type originated after catastrophic fires in boreal systems. Aspen can form suckers from the roots of fire-killed trees, up to 30 m from the main stem, and has tiny, light seeds that can travel thousands of meters (Heinselman 1996). This type can cover extensive areas because of logging and repeated post-logging fires, which eliminated most of the local pine seed sources (MN NHP 1993). Locally, where this type occurs adjacent to beaver ponds, beaver may cut many trees resulting in a very open canopy and, eventually, a Boreal Hazelnut-Serviceberry Rocky Shrubland (CEGL005197) community (M. Smith personal communication 1999).

RANGE

Isle Royale National Park

This community is uncommon, and occurs primarily in the central portions of the park.

Globally

This community is found in Ontario, northern Minnesota, northern Wisconsin, and Michigan.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies gentle to somewhat steep slopes of ridges at elevations ranging from 720 to 1110 feet. Soils are usually well drained loams or sandy loams.

Globally

This community is mostly found on level to rolling topography. It can occur on upper slopes or plateaus or in valley bottoms (Ohmann and Ream 1971). The soil is typically deep, sandy loam or loamy sand (Alban *et al.* 1991). The sites are on glacial outwash, lacustrine deposits, or moraines (Ohmann and Ream 1971, Sims *et al.* 1989). Most are well drained; however, this community can be found on somewhat poorly drained sites.

Isle Royale National Park

Aspen - birch - red maple forest is a deciduous forest with a variable physiognomy ranging from open canopy woodlands to closed canopy forests. Canopy cover varies from 40 to 90% cover; one or more of *Populus tremuloides*, *Betula papyrifera*, or *Acer rubrum* are the most abundant canopy trees. Cover of tall and short shrubs varies from 5 to 70%; *Corylus cornuta* is usually the most abundant shrub. Cover of herbs varies from 10 to 80%; the most abundant herbs are *Aster macrophyllus*, *Aralia nudicaulis*, and *Pteridium aquilinum*.

Isle Royale National Park

Globally

This deciduous forest community has a moderately closed canopy usually dominated by *Populus tremuloides* and *Betula papyrifera*. Acer rubrum and *Populus grandidentata* may be absent to dominant. Other minor components of the overstory may include Abies balsamea, Pinus resinosa, Pinus strobus, Picea glauca, and Quercus rubra. The shrub layer is approximately 2 meters tall and often well developed (MN NHP 1993). The most abundant species are Acer spicataum, Amelanchier spp., Corylus cornuta, Diervilla lonicera, and Rosa acicularis. Other shrubs present include Lonicera canadensis, Rubus pubescens, Vaccinium angustifolium, and Vaccinium myrtilloides. The herbaceous layer tends to contain many species. Common species include Aralia nudicaulis, Aster macrophyllus, Clintonia borealis, Maianthemum canadense, Trientalis borealis, and Viola spp.

COMMENTS

Isle Royale National Park

The successional status of these stands is not clear; the understory usually includes some saplings and seedlings of the canopy species, and has few or no seedlings or saplings of boreal conifers or late successional hardwoods such as sugar maple, yellow birch, or red oak. This may be a fairly stable community type, or it may be an early successional type where later successional species haven't yet become established.

VEGETATION DESCRIPTION

Isle Royale National Park

The aspen - birch / sugar maple - mixed hardwoods forest is a successional, deciduous forest with a variable physiognomy ranging from open canopy woodlands to closed canopy forests. Canopy cover varies from 50 to 80%; Betula papyrifera (25 to 75% cover) and Populus tremuloides (25 to 50% cover) are the most abundant canopy trees. Acer saccharum, Betula alleghaniensis, or Quercus rubra are present as subcanopy trees, saplings, or seedlings. This is a successional forest that seems most likely to be developing into a deciduous forest type in which sugar maple will be dominant. Acer saccharum sometimes occurs as a subcanopy tree. Cover of tall shrubs varies from 5 to 30%; Acer saccharum and Corylus

cornuta are the most common tall shrubs or saplings. Cover of short shrubs varies from 10 to 60%; the most common shrubs or small saplings are Rubus parviflorus, Acer saccharum, and Populus tremuloides. Herb cover varies from 10 to 70%; the most abundant herbs are Aster macrophyllus and Aralia nudicaulis (each usually 5 to 25%).

Globally

Deciduous trees dominate the canopy and tree reproduction layers of this community. Conifers, when present, are widely scattered. Tree density is moderate to high but substantial light penetrates the canopy due to the growth form of the two dominant species, Betula papyrifera and Populus tremuloides. Other northern hardwoods may be found in the canopy but are more common in the sapling layer. These include Acer rubrum, Acer saccharum, Betula alleghaniensis, Fraxinus pennsylvanica, Ostrya virginiana, Tilia americana, and Ulmus americana (in more mesic sites). The shrub stratum is usually not well developed due to shading from the canopy and sub-canopy trees. Scattered Acer spicatum, Corylus cornuta, Diervilla lonicera and Rubus pubescens are typical shrubs. Taxus candensis and Acer pensylvanicum are present on some sites. For example, Hansen et al. (1973) found Taxus candensis to be one of the more abundant shrubs on Isle Royale in Lake Superior. They also found this type to have the most diverse herbaceous layer of their sites. The herbaceous layer contains species such as Aralia nudicaulis, Aster macrophyllus, Clintonia borealis, Maianthemum canadense, Oryzopsis asperifolia, and Streptopus roseus. Mosses include Dicranum flagellare, Dicranum montanum, and others (Chambers et al. 1997).

VEGETATION DESCRIPTION

Isle Royale National Park

At Isle Royale NP, aspen - balsam poplar lowland forest is an open to closed canopy, deciduous forest. Canopy cover varies from 40 to 80%. The most abundant canopy trees are *Populus balsamifera*, *Betula papyrifera*, or *Populus tremuloides*; *Picea glauca* is often present. Cover of tall and short shrubs varies from 10 to 70%; *Alnus incana*, and *Rubus parviflorus* are the most abundant understory shrubs (over 50% cover) and *Lonicera hirsuta* is another common understory shrub (average 37% cover). Cover of herbs varies from 50 to 80%; the most abundant herbs are *Aster macrophyllus*, *Clintonia borealis*, *Heracleum maximum*, and *Calamagrostis canadensis*.

Globally

Stands are dominated by deciduous trees, but can contain a mix of evergreen species. Dominants include *Populus tremuloides* and *Populus balsamifera*. Other associates include *Abies balsamea, Betula papyrifera*, and *Picea glauca*. The shrub and herb layer are often fairly rich. Typical shrubs/saplings include *Abies balsamea, Alnus incana, Amelanchier* spp., *Cornus sericea, Ribes* spp., *Rosa acicularis, Rubus idaeus*, and *Rubus pubescens*. The herb layer contains *Aralia nudicaulis, Aster ciliolatus*,

Isle Royale National Park

Aster macrophyllus, Anemone quinquifolia, Calamagrostis canadensis, Carex spp. (including Carex intumescens, Carex gracillima), Clintonia borealis, Cornus canadensis, Dryopteris carthusiana, Equisetum spp. (including Equisetum sylvaticum), Galium triflorum, Maianthemum canadense, Mertensia paniculatus, Mitella nuda, Petasites frigidus var. palmatus, Streptopus roseus, and Viola renifolia. Calamagrostis canadensis can be abundant in the herb layer (Sims et al. 1989, McCarthy et al. 1994).

This community is uncommon, and has been found only in the central portion of the park.

Globally

This association is found in North Dakota, Minnesota, Michigan, Illinois, Wisconsin, Ontario, and Manitoba. It may be found in Indiana.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies poorly drained wetland depressions on flat, gentle, or moderate slopes at elevations ranging from 617 to 930 feet. Soils are poorly drained silt loam or muck that are seasonally flooded to saturated.

Globally

Stands occur on poorly drained wetland depressions on flat, gentle, or moderate slopes in valleys with impeded drainages or near lake shores. These wet pockets contain fine sandy clay loams, fine loams, mucks or soils with well-decomposed peat. Hydrology can vary from seasonally flooded to saturated. Conditions are often transitional to uplands (Sims *et al.* 1989, Minnesota NHP1993, Cleland *et al.* 1994, Chambers *et al.* 1997).

VEGETATION DESCRIPTION

Isle Royale National Park

This black ash swamp community is a deciduous wooded wetland. Canopy cover varies from 30 to 80%; Fraxinus nigra is the most abundant tree (15 to 60% cover), other trees present include Betula papyrifera and Populus tremuloides. Cover of tall shrubs varies from 10 to 60%; Alnus incana is the most abundant tall shrub (15 to 50% cover). Cover of herbs varies from 40 to 90%; the most common herbs are Symplocarpus foetidus, Equisetum arvense, Osmunda claytoniana, Athyrium filix-femina, and Thalictrum dasycarpum. Cover of nonvascular plants varies from 5 to 20%; the most abundant mosses are

Isle Royale National Park

Calliergon spp.

Globally

Canopy structure is variable, ranging from 30 to 90% cover. The canopy is dominated by Fraxinus nigra (at least 50% cover), with a diverse mix of hardwoods and conifers in the main and sub canopies, including Abies balsamea, Acer rubrum, Acer saccharum, Betula papyrifera, Betula alleghaniensis, Fraxinus pennsylvanica, Picea glauca, Populus balsamifera, Populus tremuloides, Thuja occidentalis, Tilia americana, and Ulmus americana. Shrub and sapling species include Abies balsamea, Acer spicatum, Alnus incana, Cornus sericea, Corylus cornuta, Lonicera canadensis, Prunus virginiana, Ribes triste, Rubus idaeus, and Rubus pubescens. Herbaceous species include Aralia nudicaulis, Aster macrophyllus, Athyrium felix-femina, Carex gracillima, Carex intumescens, Cinna latifolia, Circaea alpina, Clintonia borealis, Dryopteris carthusiana, Equisetum sylvaticum, Fragaria virginiana, Maianthemum canadense, Mitella nuda, Streptopus roseus, Thalictrum pubescens, and Trientalis borealis. Mosses include Climacium dendroides, Plagiomnium spp. (Sims et al. 1989, Minnesota DNR 1993, Cleland et al. 1994, Harris et al. 1996, Chambers et al. 1997). A floodplain variant may also occur, with more hardwood dominance, with wetter species present, such as Alnus incana, Calamagrostis canadensis, and Caltha palustris (Harris et al. 1996). Diagnostic features include the dominance by Fraxinus nigra.

This maple-ash swamp community is an open canopy, deciduous wooded swamp. Canopy cover varies from 50 to 60%; the most abundant tree is either *Acer rubrum* or *Betula papyrifera* (25 to 60% cover). Tall shrub cover is about 20 to 30%; the most abundant shrub is either *Alnus viridis* or *Alnus incana*. Cover of herbs varies from 60 to 90%; the most abundant herbs are *Calamagrostis canadensis*, *Carex rostrata*, *Aster macrophyllus*, and *Aralia nudicaulis*.

USGS-NPS Vegetation Mapping Program Isle Royale National Park

Globally

The canopy structure is variable, with cover ranging from open (25-60%) to closed (60-100%). Common canopy dominants include *Acer rubrum, Betula alleghaniensis, Betula papyrifera, Fraxinus nigra, Fraxinus pennsylvanica*, and occasional *Larix laricina, Pinus strobus*, and *Ulmus americana. Pinus strobus* may form a patchy supercanopy above the hardwood canopy. Common shrubs include *Alnus incana* and *Rhus vernix*. Other associates include *Ilex verticillata, Ribes* spp., and *Rubus strigosus*. Dwarf-shrubs may include *Cornus canadensis*. The herbaceous layer contains *Calamagrostis canadensis, Carex stipata, Impatiens capensis, Mitella nuda, Onoclea sensibilis, Osmunda cinnamomea, Osmunda claytoniana, Saxifraga pensylvanica*, and others (MN NHP 1993, Wovcha *et al.* 1995). A seepage swamp subtype can occur where steep sandy slopes and gravelly slopes merge with a river or stream terrace. The groundlayer can be exceptionally diverse, with characteristic seepage species including *Angelica atropurpurea, Carex bromoides, Hydrocotyle americana, Poa paludigena, Saxifraga pensylvanica*, and *Symplocarpus foetidus* (MN NHP 1993, Wovcha *et al.* 1995).

RANGE

Isle Royale National Park

This community is only found at the southwest end of Isle Royale, near Siskiwit Bay. Only two examples were sampled in 1998, one west of Hay Bay campground, and one west of Lake Halloran.

Globally

This community is found in the United States in northern and central parts of Minnesota, Wisconsin, and Michigan; and in Canada in Ontario, Manitoba, and probably elsewhere.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occurs in wetland depressions overlying conglomerate or sandstone bedrock near Siskiwit Bay. These wetlands occur at relatively low elevations (620 to 640 feet); these sites are likely old lake bed deposits from postglacial lakes (probably Lake Nipissing). Soils are saturated muck or peat. The species composition and the saturated soils (even in a very dry summer) suggest that these wetlands are kept saturated by groundwater.

Globally

Stands are found on the shores of lakes and rivers above the flooding level, as well as margins of flowage areas of peatland complexes. The substrate is primarily a well-decomposed woody peat in wet, saturated soils, but can also be a moist mineral soil. Hummock and hollow microtopography is moderately to well developed, with standing water occasionally occurring in the hollows. (Sims *et al.* 1989, MN NHP 1993, Harris *et al.* 1996).

Globally

Larix laricina, Alnus incana, Chamaedaphne calyculata, Betula pumila, Sphagnum spp.

VEGETATION DESCRIPTION

Isle Royale National Park

The tamarack rich swamp is a deciduous, needle-leaved wooded wetland. This community has a woodland physiognomy, with about 30% canopy cover of trees (over 5 m tall), from 20 to 60% cover of tall shrubs (2 to 5 m tall), about 20% cover of short shrubs (0.5 to 2 m tall), and 5 to 10% cover of dwarf shrubs (< 0.5 m tall). Larix laricina is the most abundant canopy tree (average 26% cover); Thuja occidentalis, Picea mariana, and Pinus strobus may also be present, generally with less than 10% cover, but Picea mariana can be higher. The most abundant tall shrubs are Thuja occidentalis, Betula pumila, Alnus incana, and Larix laricina. The most abundant short shrubs are Chamaedaphne calyculata, Ledum groenlandicum, and Myrica gale. The most abundant dwarf shrubs are Andromeda polifola var. glaucophylla, Vaccinium oxycoccos, Gaultheria hispidula, and Rubus pubescens. Herbs typically have about 40 to 50% cover; the most abundant herbs are Carex lasiocarpa, Calamagrostis canadensis, and Solidago uliginosa. Sphagnum spp. are abundant in the groundlayer, averaging about 40% cover.

Globally

The canopy layer varies from closed (60-100% cover) to open (25-60% cover), and may also range from 3-10 m in height. Larix laricina is the dominant tree species, with associates of Picea mariana and Thuja occidentalis. The shrub, herb, and moss layers can be very rich. The shrub layer typically contains Alnus incana, along with Abies balsamea, Cornus sericea, Salix spp., and Picea mariana. The dwarf-shrub layer is strongly ericaceous, including Ledum groenlandicum, and Gaultheria hispidula. Other dwarf-shrubs include Chamaedaphne calyculata, Linnaea borealis, Lonicera villosa, Ribes triste, Rosa acicularis, and Rubus pubescens. Herbaceous cover is variable; species include Carex disperma, Carex lacustris, Carex trisperma, Coptis trifolia, Cornus canadensis, Equisetum sylvaticum, Galium triflorum, Maianthemum canadense, Maianthemum trifolium, Mitella nuda, Trientalis borealis, and Viola renifolia. The moss layer, which is sometimes patchy, includes Dicranum polysetum, Hylocomium spendens, Pleurozium schreberi, Ptilium crista-castrensis, Rhytidiadelphus triquestrus, Sphagnum capillifolium, Spaghnum girgensohnii, and Sphagnum nemoreum (Sims et al. 1989, Minnesota NHP 1993, Harris et al. 1996).

OTHER NOTEWORTHY SPECIES

Isle Royale National Park

The orchids *Platanthera dilatata* and *Spiranthes cernua* were common in one site, and the other site had many standing dead snags of *Thuja occidentalis*.

RANGE

Isle Royale National Park

This community is found primarily at the southwest end of the island; the eastern-most site sampled is west of Chickenbone Lake, most of the sites are near Windigo and Feldtmann Ridge, where it is not uncommon.

Globally

This community is found in northern Minnesota, northern Wisconsin, northern Michigan, and Ontario. It is reported from two ecoregion subsections in the western Lake Superior basin.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies gentle to somewhat steep slopes facing northwest, northeast, or east. Sometimes it occurs in a ravine with a small stream running through. It usually occurs at elevations from about 700 to 1170 feet.

Globally

This community is found on both poorly drained lowland soils, occasionally bordering on wet, organic soils (Beals and Cottam 1960, Chambers *et al.* 1997), and gentle to somewhat steep northerly slopes (C. Reschke personal communication 1999). The soil is typically moderately acidic sandy clay with a thin litter layer.

VEGETATION DESCRIPTION

Isle Royale National Park

White cedar - yellow birch forest is a closed canopy, mixed evergreen and deciduous forest. Canopy cover varies from about 60 to 80%; the most abundant trees are *Thuja occidentalis* (25 to 60% cover), *Betula alleghaniensis* (15 to 60% cover), *Betula papyrifera* (5 to 25% cover), and *Picea glauca* (5 to 25% cover). Cover of subcanopy trees is about 10 to 20%, mostly *Betula alleghaniensis* and *Thuja occidentalis* (each 5 to 25% cover). Cover of tall shrubs varies from 0 to 30%, *Picea glauca* is

Isle Royale National Park

the most common tall shrub. Cover of short shrubs varies from 5 to 60%; the most abundant short shrubs are *Rubus* parviflorus (25 to 50% cover), *Sorbus decora* (1 to 10% cover), and *Acer spicatum* (1 to 5% cover). Cover of herbs varies from 40 to 90%; the most abundant herbs are *Clintonia borealis*, *Cornus canadensis*, *Lycopodium annotinum*, *Mitella nuda*, *Athyrium filix-femina*, *Phegopteris connectilis*, and *Symplocarpus foetidus*. Cover of mosses and lichens varies from 5 to 30%; the most common lichens are epiphytic *Parmelia* spp. and *Usnea* spp. *Hylocomium splendens* is a common groundlayer moss.

Globally

The canopy of this community is dominated by Thuja occidentalis and a variety of hardwoods, most typically Betula alleghaniensis, Betula papyrifera, and Populus tremuloides, but occasionally Acer rubrum, Acer saccharum and Fraxinus nigra. Associated conifers include Abies balsamea, Picea glauca, and, rarely, Tsuga canadensis. The understory usually contains a well developed shrub/sapling layer, including Abies balsamea, Acer spicatum, Corylus cornuta, Diervilla lonicera, Linnaea borealis, Ribes triste, Rubus pubescens, and Taxus canadensis. Herbaceous species include Aralia nudicaulis, Aster macrophyllus, Clintonia borealis, Coptis trifolia, Cornus canadensis, Dryopteris carthusiana, Galium triflorum, Gymnocarpium dryopteris, Lycopodium spp., Maianthemum canadense, Mitella nuda, Onoclea sensibilis, and Trientalis borealis. Moss species include Hylocomium splendens, Pleurozium schreberi, Rhytidiadelphus triquestrus, and others (Minnesota NHP 1993, Chambers et al. 1997). Diagnostic features include the mixed dominance of Thuja occidentalis and hardwoods, particularly Betula alleghaniensis, in an essentially upland site type.

OTHER NOTEWORTHY SPECIES

Isle Royale National Park

Information not available

CONSERVATION RANK G2Q. There are probably fewer than 100 occurrences of this community rangewide. It is reported from Minnesota (where it is ranked S2), Wisconsin (S?), Michigan (S?), and Ontario (S?). Currently there is only one occurrence documented from Minnesota. Minimal data on current acreage are available; the one occurrence documented from Minnesota has 14 acres. It is likely that many stands have been degraded by logging. This community is reported from two ecoregion subsections in the western Lake Superior basin.

VEGETATION DESCRIPTION

Isle Royale National Park

White pine - aspen - birch forest is a closed canopy forest with a variable mixture of evergreen and deciduous trees. Canopy cover of trees is usually 70 to 80%. Most sites sampled had a predominantly evergreen canopy, with less than 25% of the canopy cover made up of deciduous trees, but some were mixed. *Pinus strobus* is usually the most abundant tree (25 to 75% cover), mixed with smaller numbers of *Populus tremuloides*, *Betula papyrifera*, and *Abies balsamea*. Cover of short shrubs varies from 10 to 40%; the most abundant short shrub is *Rubus parviflorus* (5 to 25% cover); other characteristic shrubs are *Diervilla lonicera* and *Amelanchier* spp. Cover of herbs varies from 20 to 60%; the most abundant herbs are *Aster macrophyllus* and *Aralia nudicaulis*.

Globally

The tree canopy is mixed evergreen-deciduous. *Pinus strobus* may form a supercanopy over a mixture of other species, including *Betula papyrifera*, *Populus tremuloides*, *Picea glauca*, and *Abies balsamea*. Less frequent are *Pinus resinosa*, *Populus*

Isle Royale National Park

grandidentata, and Thuja occidentalis. The subcanopy can include Acer rubrum and Acer saccharum, as well as a mixture of canopy species. Tall shrubs and saplings include Abies balsamea, Acer spicatum, Amelanchier spp., and Corylus cornuta. Short shrubs include Diervilla lonicera, Linnaea borealis, Lonicera canadensis, and Vaccinium myrtilloides. Viburnum cassinoides may be present in the eastern part of the range. Herbs include Aralia nudicaulis, Aster macrophyllus, Clintonia borealis, Cornus canadensis, Maianthemum canadense, Oryzopsis asperifolia, Pteridium aquilinum, Streptopus roseus, and Trientalis borealis. Typical mosses include Pleurozium schreberi, Dicranum polysetum, and Dicranum flagellare (Sims et al. 1989, Minnesota NHP 1993, Chambers et al. 1997).

VEGETATION DESCRIPTION

Isle Royale National Park

White spruce - fir - aspen forest is a closed to open canopy, mixed evergreen and deciduous forest. It contains two structural phases or variants. The main type is the closed canopy forest type with a canopy cover of about 60 to 80%. The most abundant canopy trees are *Picea glauca* (5 to 50% cover), *Populus tremuloides* (5 to 25% cover), *Betula papyrifera* (5

Isle Royale National Park

to 25% cover), Abies balsamea, and Thuja occidentalis (each 1 to 5% cover). A. balsamea is uncommon in the 1936 burn area. There may be a subcanopy (0 to 50% cover) with Abies balsamea and Picea glauca (each 0 to 25% cover). Cover of short shrubs varies from about 10 to 90%; the most abundant short shrubs are Rubus parviflorus (5 to 25% cover) and Abies balsamea (1 to 5% cover). Cover of herbs varies from 40 to 100%; the most abundant herbs are Aralia nudicaulis and Aster macrophyllus (each 5 to 25% cover).

The spruce-fir-aspen open forest variant is a mixed evergreen and deciduous community with a variable physiognomy, ranging from open canopy forest to woodland (usually 20 to 50% canopy cover, sometimes more or less). The most abundant trees over 5 m tall are Betula papyrifera, Picea glauca, and Populus tremuloides; each of these typically occurs with about 5 to 25% cover, occasionally they will have up to 50% cover. Other trees occasionally present include Thuja occidentalis, Abies balsamea, Picea mariana, and Betula alleghaniensis. Cover of tall shrubs is usually about 5 to 30%; the most abundant tall shrubs are Picea glauca, Abies balsamea, Thuja occidentalis, and Sambucus racemosa. Cover of short shrubs varies from about 5 to 60%; the most abundant short shrubs are browsed Abies balsamea scrub, Rubus parviflorus, Corylus cornuta, and Diervilla lonicera. Herbaceous cover typically varies from 30 to 50%. The most abundant herbs are Aster macrophyllus, Aralia nudicaulis, Pteridium aquilinum, Cornus canadensis, and Calamagrostis canadensis. Many sites with this community type are recovering from past disturbance; standing dead snags of Betula papyrifera and Populus tremuloides are common.

Globally

The overstory composition is varied. The most abundant tree species typically are Abies balsamea, Acer rubrum, Picea glauca, Pinus strobus, Populus tremuloides, and Populus balsamifera. The sapling/shrub layer is usually moderately well developed. Acer spicatum, Corylus cornuta, Rosa acicularis, Rubus pubescens, and saplings of Abies balsamea are the most commonly encountered in this stratum. Herb diversity is usually high. Aralia nudicaulis, Aster ciliolatus, Aster macrophyllus, Clintonia borealis, Cornus canadensis, Galium triflorum, Maianthemum canadense, Mitella nuda, and Trientalis borealis are typical of this community.

On Isle Royale, two structural phases or variants have been described, and these may apply elsewhere. The principal type is the more closed canopy variant, with 60-80% cover. The second is the more open woodland variant, with 20-50% cover (C. Reschke personal communication 1999). Many of these sites are recovering from past disturbance, either blowdowns, (in which case the shrub/sapling layer can be very dense), moose-browsing (in which case the shrub/sapling layer can be fairly open), or fire.

COMMENTS

Isle Royale National Park

The spruce-fir-aspen open forest variant is a woodland phase of the spruce-fir-aspen forest that appears to be caused by disturbance such as logging or fire. On Isle Royale it may be kept more open than is typical as a result of heavy browsing by moose. The two species most severely impacted by moose browsing, especially at the southwest end of the island, are *Abies balsamea* and *Sorbus decora*. Herbivory by aspen tortrix was also noted at many sites, resulting in moderate (or sometimes severe) defoliation of *Populus tremuloides*.

RANGE

Isle Royale National Park

This community occurs primarily at the southwest end of the island; the furthest east it was sampled was near the west end of Chickenbone Lake.

Globally

This association can be found in Michigan and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions with saturated soils, at elevations ranging from 700 to 1200 feet.

Globally

This type is found in confined basins surrounded by upland or as part of large wetland complexes. If associated with peatlands, it is usually found on the upland border where wetter, more minerotrophic conditions exist. Soils are either deep, well decomposed peats or shallow well decomposed peats over clay. Microtopography of hummocks and hollows may be well developed or absent. Standing water is often present. The water regime is seasonally flooded to saturated (M. Smith personal communication 1999).

VEGETATION DESCRIPTION

Isle Royale National Park

This white cedar - black ash swamp is a wooded wetland with a mixed evergreen and deciduous tree canopy, and a variable canopy closure ranging from 40 to 100% canopy cover. *Thuja occidentalis* and *Fraxinus nigra* are codominant (each typically with 25 to 50% cover). *Betula alleghaniensis* is a common associate in the canopy (typically with less than 20% cover). The shrub layer is variable, ranging from 5 to 50% cover. The most abundant tall shrubs are *Alnus incana*, and saplings of *Fraxinus nigra*, *Thuja occidentalis*, and *Acer spicatum*. Dwarf shrub cover varies from 0 to 20%, and herb

Isle Royale National Park

cover varies from 40 to 90%. Rubus pubescens is a common dwarf shrub, and Symplocarpus foetidus is the most abundant herb. Other characteristic herbs are Carex intumescens, Mitella nuda, Equisetum fluviatile, and Athyrium filix-femina.

Globally

Canopy cover is variable, sometimes fairly open. Thuja occidentalis and Fraxinus nigra dominate the canopy, but some stands may have Fraxinus nigra in the upper canopy and Thuja occidentalis in the lower canopy. Thuja occidentalis also tends to occur on the hummocks and Fraxinus nigra in the hollows. Populus tremuloides can be a major component, but this may be caused by logging of Thuja occidentalis. Acer rubrum, Betula alleghaniensis, and Picea glauca may also be present. Shrubs include Acer spicatum, Alnus incana, Cornus alternifolia, Lonicera canadensis, Ribes spp., and Rubus pubescens. The herb rich layer includes Aralia nudicaulis, Arisaema triphyllum, Carex gracillima, Carex intumescens, Clintonia borealis, Cornus canadensis, Dryopteris carthusiana, Galium triflorum, Maianthemum canadense, Tiarella cordifolia and Trientalis borealis (Chambers et al. 1997). In northern Minnesota, moss cover is highly variable, ranging from 30-90%. The most abundant mosses are Rhytidiadelphus triquetrus, Calliergon cordifolium, Calliergon giganteum, Mniaceae, Thuidium spp., Sphagnum varnstorfii, and Sphagnum squarrosum (M. Smith personal communication 1999).

ALLIANCE PINUS (BANKSIANA, RESINOSA) WOODLAND ALLIANCE

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is scattered throughout the park on the tops of ridges.

Globally

This association is found in northern Minnesota, Michigan, southern Manitoba, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies sites on tops of ridges or on steep, usually south- or southeast-facing upper slopes of ridges (occasionally on northwest-facing exposures), mostly on basalt bedrock.

Globally

Stands typically occur on shallow, sandy or rocky sites. Soils vary from talus slopes and bare bedrock to deep mineral soils of coarse to fine sand (Sims et al. 1989, McCarthy et al. 1994).

Globally

Pinus banksiana, Pinus strobus, Pinus resinosa, Juniperus communis, Vaccinium angustifolium, Cladina spp.

VEGETATION DESCRIPTION

Isle Royale National Park

This boreal pine rocky woodland is an open canopy, usually evergreen, woodland that occurs mainly on exposed rocky summits. Canopy cover of trees over 5 m tall varies from 10 to 60% cover. The most abundant trees are one of three pines: either *Pinus banksiana*, *Pinus strobus*, or *Pinus resinosa*. Usually one of these species is dominant at a site and others are rare or absent. Other trees commonly present with less than 5% cover *include Picea glauca*, *Abies balsamea*, *Populus tremuloides*, *Thuja occidentalis*, and *Picea mariana*. The tall shrub layer usually has about 5 to 20% cover and includes saplings or browsed scrub of canopy trees, plus *Sorbus decora* and *Amelanchier* sp. (probably *Amelanchier bartramiana*). Short shrubs (including dwarf shrubs) usually have from about 5 to 60% cover; the most abundant low shrubs are *Juniperus communis*,

Isle Rovale National Park

Diervilla lonicera, Rosa acicularis, Rubus parviflorus, Vaccinium angustifolium, Vaccinium myrtilloides, and Arctostaphylos uva-ursi. Herbaceous cover varies from about 10 to 70%; the most common herbs are Aster macrophyllus, Danthonia spicata, Maianthemum canadense, Pteridium aquilinum, Deschampsia flexuosa, and Oryzopsis asperifolia. Cover of nonvascular plants varies from 10 to 60%; the most abundant nonvascular plants are crustose and foliose lichens, Cladina spp. and Pleurozium schreberi. At some sites on southeast slopes of Stanley Ridge there is a narrow zone or open meadow associated with this community, just downhill from the pines. Emmet Judziewicz has observed numerous spring ephemerals (some quite rare on Isle Royale) in these meadows, which may be a type of snowbank community (in microhabitats where deep snow accumulates in winter).

Globally

The tree canopy is variable, typically open, with stands often being dominated by a single pine species, but the pines could be *Pinus banksiana*, *Pinus resinsa* or *Pinus strobus*. Occasionally *Picea mariana* is present, particularly northward in the range of the type. The understory is quite open, with scattered clumps of shrubby *Picea mariana*. *Abies balsamea*, *Pinus strobus*, and *Quercus ellipsoidalis* constitute the scrub/shrub layer which, when present, comprises 20-30% cover. The dwarf-shrub layer contains *Vaccinium angustifolium* and *Vaccinium myrtilloides*, with occasional *Juniperus communis*, *Cornus canadensis*, *Diervilla lonicera*, *Amelanchier* spp, *Rubus* spp., and *Arctostaphylos uva-ursi*. The herbaceous layer is sparse, containing *Agrostis scabra*, *Danthonia spicata*, *Maianthemum canadense*, and *Melampyrum lineare*. Moss and lichen cover is highly variable, ranging from 20-90%, though most commonly around 30%. Moss species include *Dicranum polysetum* and *Pleurozium shreberi*. Lichens include *Cladina rangifera*, *Cladina mitis*, and *Cladina stellaris* (Sims *et al.* 1989, McCarthy *et al.* 1994, M. Smith personal communication 1999).

COMMENTS

Isle Royale National Park

Many sites with this community have a fire history. Some, if not all, were probably established following a severe burn; in some cases (as at the west end of the Minong Ridge) an accidental fire can consume the canopy trees, leaving little more than bare rock and some herbs, resulting in a Poverty grass barrens. Following a burn the vegetation may or may not succeed back to a pine woodland, depending on available seed sources. In at least one burn site (west end of Minong Ridge) no reproduction of pines was observed in 1998, following a fire just a few years earlier. Jack pine (*Pinus banksiana*) growing on rocky summits may not require fire for reproduction; in some places the heat of the bedrock during warm summer days can be sufficient to open jack pine cones. On Stanley Ridge, some jack pines were observed in 1997 with low branches extending across the rock surface as if they might reproduce by layering (vegetative reproduction). Similar layering in red pine has been observed on rocky ridges near the lakeshore on the Keweenaw Peninsula. A ground fire near pines with low, layering branches would likely cause a crown fire, killing the trees with this unusual growth form.

RANGE

Isle Royale National Park

This community is uncommon, widely scattered around the park, often in sites where it grades into common juniper rocky krummholz.

Globally

This association is found in Michigan, Minnesota, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies gentle to steep slopes of rocky ridges, usually at low elevations near the Lake Superior shore, but sometimes also on high inland ridges. Sites are often on southeast- to south-facing slopes; elevations usually range from 615 to 800 feet, at least one site is at 1260 feet. Soils are usually sandy loams that are well drained to rapidly drained. Usually about 5 to 30% of the ground surface is exposed bedrock.

Globally

Stands occur between the open basalt bedrock and the inland forests. Soils are thin and exposed areas of bedrock are common. The bedrock includes basalt, volcanic conglomerates, and localized rhyolites (Albert *et al.* 1995). This community occupies gentle to steep slopes of rocky ridges, usually at low elevations near the Lake Superior shore, but sometimes also on high inland ridges. Sites are often on southeast- to south-facing slopes; elevations usually range from 615 to 800 feet, at least one site is at 1260 feet. Soils are usually sandy loams that are well drained to rapidly drained. Usually about 5 to 30% of the ground surface is exposed bedrock (C. Reschke personal communication 1999).

VEGETATION DESCRIPTION

USGS-NPS Vegetation Mapping Program Isle Royale National Park

Isle Royale National Park

Spruce - fir basalt bedrock glade is an open canopy, evergreen woodland. Canopy cover varies from 20 to 50% and cover of tall shrubs (stunted trees) varies from 5 to 30%. *Picea glauca* is the most abundant tree (> 5 m tall) or tall shrub (2 - 5 m) with 20 to 50% cover. Other tree species that are present at low abundance (under 25% cover each) are *Abies balsamea*, *Betula papyrifera, Sorbus decora*, and *Thuja occidentalis*. Cover of short shrubs varies from 5 to 40%; *Juniperus communis, Amelanchier* spp., *Lonicera dioica*, *Rosa acicularis*, and *Diervilla lonicera* are common shrubs. Cover of herbs is usually 30 to 50%; *Danthonia spicata*, *Deschampsia flexuosa*, *Aster macrophyllus*, and *Pteridium aquilinum* are the most abundant herbs. Cover of nonvascular plants varies from 5 to 60%; *Cladina* spp. and *Pleurozium schreberi* are the most abundant nonvascular plants.

Globally

This community consists of scattered, open-grown trees, scattered shrubs or shrub thickets, and a partial layer of graminoids, mosses, and lichens. The scattered, and often stunted, tree layer contains Abies balsamea, Betula papyrifera, Picea glauca, Pinus resinosa, Pinus strobus, Quercus rubra, Sorbus decora, and Thuja occidentalis. The shrub layer is very sparse and may contain Amelachier spp. and Juniperus communis. More prominent is the dwarf-shrub layer, which contains Arctostaphylos uva-ursi, Epigaea repens, Juniperus horizontalis, Lonicera dioica, Rosa acicularis, and Vaccinium angustifolium. The herbaceous layer is characterized by Achillea millefolium, Calamagrostis canadensis, Danthonia spicata, Festuca saximontana (= Festuca ovina var. saximontana), Fragaria virginiana, and Sibbaldiopsis tridentata (=Potentilla tridentata). Mosses and lichens occur in localized patches throughout the stand.

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is fairly common and widespread near the lakeshore, especially on the southeast-facing, basalt bedrock shores. The variant of this association is restricted to Passage Island; it may also occur on a few other islands or peninsulas at the extreme northeast end of the park.

Globally

Known from northwestern Michigan along and near shores of Lake Superior and on Isle Royale. It probably also occurs along the north shore of Lake Superior in Ontario, and possibly along the northern shores of Lake Huron: north channel and Georgian Bay areas.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies exposed rock outcrops near the Lake Superior shore and on some rocky inland ridges exposed to wind (sometimes just above a cliff). When near a lakeshore fully exposed to wave wash and ice scour, this community usually occurs in a zone between the open bedrock lakeshore and adjacent forest communities. In more protected situations, such as shores of islands on the interior side of harbors or in narrow channels, this community extends down the rocks to the lake. This community occurs on gentle to steeply sloping rock outcrops, usually with a south- to southeastern-facing slope, at elevations ranging from 600 to 920 feet.

The variant of this community occupies a narrow zone at the upper edge of the Great Lakes basalt (conglomerate) bedrock lakeshore, at the transition between open rocky lakeshore and upland woods or boggy wetlands.

Globally

Stands are found on exposed, igneous bedrock substrates. In Michigan, stands are found at higher elevations in the Porcupine Mountains, where exposure to wind and cold has stunted the vegetation. It occupies exposed rock outcrops near the Lake Superior shore and on some rocky inland ridges exposed to wind (sometimes just above a cliff).

VEGETATION DESCRIPTION

Isle Royale National Park

This common juniper rocky krummholz is an evergreen shrubland that includes stunted, krummholz forms of some tree species. There may be a sparse cover of trees over 5 m tall (usually 0 to 10% cover); the most common trees are *Picea glauca*, *Betula papyrifera*, *Populus tremuloides*, *Picea mariana*, and *Thuja occidentalis* (each with 1 to 5% cover). Tall shrub cover varies from 0 to 10%; mostly these are stunted, scrub forms of trees such as *Picea glauca* and *Thuja occidentalis*, as well as the shrub *Alnus viridis*. The cover of short shrubs (0.5 to 2 m tall) varies from 0 to 10%; the most abundant short shrub is *Rubus parviflorus*. Cover of dwarf shrubs (under 0.5 m tall) varies from 20 to 80%; the most abundant dwarf shrubs are *Juniperus communis* (25 to 50% cover), *Arctostaphylos uva-ursi* (5 to 25% cover), *Vaccinium angustifolium*, *Juniperus horizontalis*, *Diervilla lonicera*, *Amelanchier* spp., and *Viburnum edule* (each with 1 to 5% cover). Herbaceous cover varies from 5 to 30%; the most abundant herbs are *Danthonia spicata* (1 to 10% cover), *Sibbaldiopsis tridentata* (=*Potentilla tridentata*), *Aster macrophyllus*, *Aralia nudicaulis*, *Pteridium aquilinum*, *Hieracium* spp., *Deschampsia cespitosa*, and *Deschampsia flexuosa* (each with 1 to 5% cover). Cover of nonvascular plants varies from 20 to 80%; the most abundant lichens and mosses are *Cladina* spp. (reindeer lichens, 5 to 50% cover), crustose lichens (5 to 25% cover), *Pleurozium schreberi* (5 to 25% cover), foliose lichens such as *Dermatocarpon miniatum* and *Xanthoparmelia* spp., and the mosses *Grimmia* spp. and *Dicranum* spp.

The variant of this association, Thuja occidentalis - Abies balsamea / Chamaedaphne calyculata / Empetrum nigrum krummholz, is an evergreen shrubland that is composed of stunted, scrub forms of evergreen trees mixed with shrubs. The tall shrub layer has 20 to 50%; stunted, shrub-size Thuja occidentalis and Abies balsamea, and Alnus viridis are the most abundant tall shrubs (2 to 5 m tall). The short shrublayer has 20 to 60% cover; Chamaedaphne calyculata and Ledum groenlandicum are the most abundant short shrubs. Dwarf shrubs (under 0.5 m tall) have about 20 to 30% cover; the most abundant dwarf shrubs are Empetrum nigrum, Arctostaphylos uva-ursi, Juniperus horizontalis, Vaccinium uliginosum, and Vaccinium angustifolium. The herbaceous layer is sparse, with about 5 to 10% cover; characteristic herbs are Sibbaldiopsis tridentata (= Potentilla tridentata), Clintonia borealis, Geocaulon lividum, Lilium philadelphicum, and Lycopodium annotinum. There is usually about 10 to 20% cover of nonvascular plants, including crustose and foliose lichens, Cladina spp., and mosses.

Globally

The shrub/scrub canopy varies from open to closed. In the Upper Peninusla of Michigan the scrub layer includes stunted Quercus rubra and Juniperus communis. The dwarf-shrub layer contains Juniperus horizontalis and Arctostaphylos uvaursi. This common juniper rocky krummholz is an evergreen shrubland that includes stunted, krummholz forms of some tree species. There may be a sparse cover of trees over 5 m tall (usually 0 to 10% cover); the most common trees are Picea glauca, Betula papyrifera, Populus tremuloides, Picea mariana, and Thuja occidentalis (each with 1 to 5% cover). Tall shrub cover varies from 0 to 10%; mostly these are stunted, scrub forms of trees such as Picea glauca and Thuja occidentalis, as well as the shrub Alnus viridis. The cover of short shrubs (0.5 to 2 m tall) varies from 0 to 10%; the most abundant short shrub is Rubus parvillorus. Cover of dwarf shrubs (under 0.5 m tall) varies from 20 to 80%; the most abundant dwarf-shrubs, with cover between 3-50%, are Juniperus communis and Arctostaphylos uva-ursi. Less abundant species, with cover between 1 and 5%, include Vaccinium angustifolium, Juniperus horizontalis, Diervilla lonicera, Amelanchier spp., and Viburnum edule. Herbaceous cover varies from 5 to 30%; the most abundant herbs, with cover between 1 and 5%, are Danthonia spicata, Sibbaldiopsis tridentata (=Potentilla tridentata), Aster macrophyllus, Aralia nudicaulis, Pteridium aquilinum, Hieracium spp., Deschampsia cespitosa, and Deschampsia flexuosa. Cover of nonvascular plants varies from 20 to 80%; the most abundant lichens and mosses, with cover between 5 and 25%, are Cladina spp. (reindeer lichens), crustose lichens, and Pleurozium schreberi. Less common are the foliose lichens, such as Dermatocarpon miniatum and Xanthoparmelia spp., and the mosses Grimmia spp. and Dicranum spp. (Reschke personal communication 1999).

A variant of this association found on Isle Royale, and perhaps elsewhere in northern Ontario, is the *Thuja occidentalis - Abies balsamea / Chamaedaphne calyculata / Empetrum nigrum* krummholz. It is an evergreen shrubland that is composed of stunted, scrub forms of evergreen trees mixed with shrubs. The tall shrub layer has 20 to 50% cover; stunted, shrubsize *Thuja occidentalis* and *Abies balsamea*, and *Alnus viridis* are the most abundant tall shrubs (2 to 5 m tall). The short shrublayer has 20 to 60% cover; *Chamaedaphne calyculata* and *Ledum groenlandicum* are the most abundant short shrubs. Dwarf shrubs (under 0.5 m tall) have about 20 to 30% cover; the most abundant dwarf shrubs are *Empetrum nigrum*, *Arctostaphylos uva-ursi*, *Juniperus horizontalis*, *Vaccinium uliginosum*, and *Vaccinium angustifolium*. The herbaceous layer is sparse, with about 5 to 10% cover; characteristic herbs are *Sibbaldiopsis tridentata* (= *Potentilla tridentata*), *Clintonia borealis*, *Geocaulon lividum*, *Lilium philadelphicum*, and *Lycopodium annotinum*. There is usually about 10 to 20% cover of nonvascular

Globally

This type is reported from Isle Royale National Park in Michigan, where this community is rare, and occurs primarily at the northeast end of the park.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies sites on very steep talus slopes or cliffs, typically facing northwest.

Globally

This association has only been described at Isle Royale NP. The global description is the same as the local description until more examples can be examined.

VEGETATION DESCRIPTION

Isle Royale National Park

This Great Lakes boreal cliff type is a closed canopy forested scrub, with about 80% canopy cover. *Acer spicatum* is dominant in the canopy, with over 50% cover; other tree species present include *Thuja occidentalis, Betula papyrifera*, and *Picea glauca*. There is about 30% cover of short shrubs; *Taxus canadensis* and *Rubus parviflorus* are the most abundant shrubs. Cover of herbs is about 30%; the most abundant herbs are *Gymnocarpium dryopteris* and *Mitella nuda*. Cover of

Isle Royale National Park

nonvascular plants is about 20%; Pleurozium sehreberi is a common moss.

Globally

This association has only been described at Isle Royale NP. The global description is the same as the local description until more examples can be examined.

VEGETATION DESCRIPTION

Isle Royale National Park

Mountain ash - mountain maple forest is a rare type of deciduous forested scrub. Canopy cover varies from 40 to 90%; *Sorbus decora* is the most abundant canopy tree, *Acer spicatum* may be codominant, and other less common trees include *Abies balsamea, Picea glauca*, and *Betula papyrifera*. Cover of shrubs varies from about 10 to 70%; *Oplopanax horridus* may be a common understory shrub (but is absent in some places); other common shrubs are *Rubus idaeus, Sambucus racemosa*, and *Taxus canadensis*. *Dryopteris carthusiana* is the most abundant herb, (25 to 75% cover); other common herbs are *Gymnocarpium dryopteris* (20 to 60% cover) and *Maianthemum canadense* (5 to 35% cover). Cover of nonvascular plants is

Isle Royale National Park

about 5 to 25%; the most abundant nonvascular plant is the epiphytic lichens called 'old man's beard' or 'hairy lichens' (*Usnea* spp.).

Globally

This association has only been described at Isle Royale NP. The global description is the same as the local description until more examples can be examined.

CLASSIFICATION CONFIDENCE LEVEL 3

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is fairly common on ridges and rocky summits throughout the park.

Globally

This association is found in Michigan and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies exposed ridges and rocky summits. This community often has evidence of past fires; it is likely a successional stage following a severe burn. It seems to be an intermediate successional stage after Poverty grass barrens, and gradually developing into a woodland. Soils are often very shallow, and successional development is very slow on the exposed rocky summits where this community is found; so the community may be a fairly long-lived and stable successional stage.

Globally

This type occurs on a wide variety of slopes, soils, topographic positions and moisture regimes. It typically arises because of natural or human disturbance, most commonly beavers, fire, logging and blow down. This community can also occur without disturbance, usually on dry rock ridgetops that have thin, acidic soils. These sites, however, are usually so small that they are often included within other communities (C. Reschke personal communication 1999, M. Smith personal communication 1999).

Corylus cornuta, Diervilla lonicera, Amelanchier spp., Hieracium piloselloides

VEGETATION DESCRIPTION

Isle Royale National Park

This boreal rocky shrubland is a deciduous shrubland with variable physiognomy and composition. This community often has a sparse tree layer, with about 5 to 20% cover of trees over 5 m tall; the most common trees are *Picea glauca*, *Populus tremuloides*, and *Sorbus decora*. The tall shrub layer varies from 0 to 70% cover; the most abundant tall shrubs are

USGS-NPS Vegetation Mapping Program Isle Royale National Park

Corylus cornuta, Crataegus douglasii, Picea glauca, Prunus pensylvanica, and Sorbus decora. The short shrub layer (including dwarf shrubs) varies from about 10 to 80% cover; the most abundant short shrubs are Diervilla lonicera, Amelanchier sp., Rubus parviflorus, Juniperus communis, Rubus idaeus, Rosa acicularis, and Arctostaphylos uva-ursi. The herb layer varies from 5 to 80% cover; the most abundant herbs are Aster macrophyllus, Hieracium piloselloides, Clinopodium vulgare, Poa compressa, Danthonia spicata, and Pteridium aquilinum. The cover of nonvascular plants varies from about 5 to 60%, with lichens (including Cladina spp.), and mosses.

Globally

The vegetation is dominated by shrubs, with a strong graminoid layer. Dominant shrubs include Amelanchier spp., Corylus cornuta, and Prunus virginiana. Other shrubs include Acer spicatum, Juniperus communis, Rosa acicularis, and Rhus typhina. Associated herbs include Danthonia spicata, Hieracium spp., and Poa compressa. This community often has a sparse tree layer, with about 5 to 20% cover of trees over 5 m tall. The species are quite variable, but the most common trees are Picea glauca and Populus tremuloides. The tall shrub layer varies from 0 to 70% cover. At Isle Royale National Park, the most abundant tall shrubs are Corylus cornuta, Crataegus donglasii, Picea glauca, Prunus pensylvanica, and Sorbus decora; the short shrub layer (including dwarf shrubs) varies from about 10 to 80% cover, with the most abundant short shrubs being Diervilla lonicera, Amelanchier sp., Rubus parviflorus, Juniperus communis, Rubus idaeus, Rosa acicularis, and Arctostaphylos uva-ursi. At Voyageurs National Park the tall shrub layer contains Acer spicatum, Populus tremuloides, Corylus cornuta, and/or Abies balsamea; where the canopy of tall shrubs is more open, short shrubs such as Rubus strigosus, Rubus pubescens, Taxus canadensis and Juniperus communis exist at low to moderate cover. On Isle Royale the herb layer varies from 5 to 80% cover; the most abundant herbs are Aster macrophyllus, Hieracium piloselloides, Clinopodium vulgare, Poa compressa, Danthonia spicata, and Pteridium aquilinum. The cover of nonvascular plants varies from about 5 to 60% cover, with lichens (including Cladina spp.), and mosses. At Voyaguers, the density and composition of the herbaceous strata is highly variable. The most common species include Aster macrophyllus, Pteridium aquilinum, and Polygonum cilinode. On wetter sites, herbaceous species such as Calamagrostis canadensis and Scirpus cyperinus may dominate. (C. Reschke personal communication 1999, M. Smith personal communication 1999).

COMMENTS

Globally

This community often has evidence of past fires; it can be a successional stage following a severe burn. It seems to be an intermediate successional stage after Poverty grass barrens that may gradually develop into a woodland. Soils are often very shallow, and successional development is very slow on the exposed rocky summits where this community is found; so the community may be a fairly long-lived and stable successional stage (C. Reschke personal communication 1999). This type can also arise after logging has removed the tree canopy. In these circumstances, the shrubs are typically dense *Populus tremuloides* saplings. This community is also common on slopes above beaver ponds where beaver have removed all or most of the tree canopy. In these situations, the shrubs are usually dense *Corylus cornuta* and *Acer spicatum*. Finally this type can also occur on ridge tops, high slopes and other places where high winds have blown down the trees in the canopy (M. Smith personal communication 1999).

Rubus parviflorus

VEGETATION DESCRIPTION

Isle Royale National Park

Thimbleberry shrubland is a deciduous shrubland. There may be a sparse tree layer with 10 to 20% cover; the most common trees are *Betula papyrifera*, *Picea glauca*, and *Populus tremuloides*. A tall shrub layer may be present, cover of tall shrubs varies from 0 to 40%; the most abundant tall shrubs are saplings or browsed scrub of *Abies balsamea*. The short shrub layer (including dwarf shrubs) has from 40 to 80% cover; *Rubus parviflorus* is the most abundant shrub (usually 25 to 50% cover); *Rubus idaeus* may also be present. Cover of the herbaceous layer varies from 20 to 90% cover; the most abundant herbs are *Aralia nudicaulis*, *Streptopus roseus*, *Aster macrophyllus*, *Clintonia borealis*, *Equisetum arvense*, *Galium triflorum*, *Gymnocarpium dryopteris*, and *Linnaea borealis*. There may be up to about 10% cover of lichens. This shrubland seems to be a successional type following disturbance, (for example, disturbance by fire or clearing) that will develop into a mixed

Isle Royale National Park

or deciduous forest. Standing dead snags of Betula papyrifera are common in several examples.

Globally

This association has only been described at Isle Royale NP. The global description is the same as the local description until more examples can be examined.

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is common and occurs throughout the park.

Globally

This association is found in the Midwest and Northeast United States.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions with saturated or seasonally flooded muck soils. It mostly occurs at elevations ranging from 600 to 750 feet, but it can occur as high as 1230 feet.

Globally

Sites are typically along streams, lakeshores, edges of beaver meadows, swales associated with small streams in peatlands or upland forests, or near seeps. Most have little to no slope, but some sites are on moderate slopes. Hydrologic conditions can range from temporarily flooded to semipermanently flooded. The water that affects this alliance is non-stagnant, nutrient rich, and often slightly calcareous (Curtis 1959). Soils are wet, often mucks or peats (Anderson 1982, Chapman *et al.* 1989).

CHARACTERISTIC SPECIES *Isle Royale National Park*

Alnus incana

Globally

Alnus incana, Calamagrostis canadensis

VEGETATION DESCRIPTION

Isle Royale National Park

The speckled alder swamp is a wooded wetland dominated by tall, deciduous shrubs. There may be a sparse tree layer with up to 20% cover; common trees include *Picea glauca, Thuja occidentalis, Betula papyrifera*, and *Fraxinus nigra* (each less than 5% cover). The tall shrub layer has 30 to 100% cover; *Alnus incana* is the most abundant shrub (average is 50 to 75% cover); other shrubs occasionally present include *Cornus sericea, Rubus idaeus,* and *Rubus parviflorus* (each with less than 10% cover). Herbaceous cover varies from 40 to 90%; the most abundant herbs are *Calamagrostis canadensis* (usually 5 to 25% cover) and *Symplocarpus foetidus* (usually less than 10% cover). Other characteristic herbs are *Caltha palustris*,

USGS-NPS Vegetation Mapping Program Isle Royale National Park

Carex stricta, Impatiens capensis, Thalictrum dasycarpum, and Equisetum fluviatile. Mosses may be common in the groundlayer, especially Sphagnum spp. and Calliergon spp. (each with less than 10% cover).

Globally

The vegetation is dominated by tall shrubs, 2-8 meters tall, with a moderately open to dense shrub canopy. There is an understory of shorter shrubs and herbaceous species. The density of the understory varies inversely with the tall shrub canopy. The overstory is usually overwhelmingly dominated by *Alnus incana*, but where it is not as dominant, other shrubs, such as *Cornus sericea, Rubus idaeus, Salix* spp., *Spiraea alba*, and *Viburnum* spp. can be found. The herbaceous layer contains species such as *Aster simplex, Calamagrostis canadensis, Caltha palustris, Carex lacustris, Carex prairea, Eupatorium maculatum, Impatiens capensis, Lycopus uniflorus, Scirpus atrovirens, Symplocarpus foetidus, Thelypteris palustris, and <i>Typha* spp. Mosses include *Climacium dendroides*. Where the tall shrub canopy is open, the graminoids can become dense. Trees are found in many stands, including *Acer rubrum, Fraxinus nigra*, and *Thuja occidentalis* (Anderson 1982, Curtis 1959, Harris *et al.* 1996, Minnesota NHP 1993).

balsamea, Sorbus decora, and Alnus viridis (each usually 1 to 5% cover). Cover of short shrubs varies from 40 to 90%; the most abundant short shrubs are Taxus canadensis (5 to 50% cover, average is 26%), Viburnum edule (5 to 25% cover), Oplopanax horridus (5 to 25% cover), Prunus pensylvanica (5 to 25%), Cornus sericea (1 to 5%), and Chamaedaphne calyculata (1 to 5%). Cover of dwarf-shrubs varies from 0 to 70%, the most abundant dwarf-shrubs are Diervilla lonicera and Empetrum nigrum (each with 5 to 25% cover). Cover of herbs varies from 10 to 70%; the most abundant herbs are Lycopodium annotinum, Cornus canadensis, Dryopteris expansa, and Clintonia borealis (each usually 5 to 25% cover). Cover of nonvascular plants is usually less than 10%; the most abundant nonvascular plants are foliose and crustose lichens, Pleurozium schreberi, and Dicranum polysetum.

There is an uncommon variant of this association. The *Abies balsamea / Taxus canadensis* Woodland variant is an open canopy, evergreen woodland that is a rare variant of the canada yew - squashberry mixed shrubland. Canopy cover of trees over 5 m tall is about 50%; *Abies balsamea* is the single most abundant tree (25 to 50% cover). The shrub layer is a dense thicket with about 70% cover; *Taxus canadensis* is the most abundant shrub (over 50 to 75% cover), other characteristic shrubs mixed with the *Taxus* include *Oplopanax horridus, Alnus viridis, Sorbus decora*, and *Viburnum edule*. Cover of herbs is about 20%; the most abundant herbs are *Dryopteris expansa, Cornus canadensis*, and *Lycopodium annotinum*. This variant is only known from ridges on Passage Island; it may also occur in other areas in the northeastern end of the park.

Globally

This association has only been described at Isle Royale NP. The global description is the same as the local description until more examples can be examined.

RANGE

Isle Royale National Park

This community is an uncommon community that is scattered around the park.

Globally

This association is found in northern Minnesota, northern Wisconsin, northern Michigan, Ontario, and Manitoba.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions at elevations ranging from 600 to 760 feet.

Globally

Sites are found on raised bog landforms in large peatland complexes, basin bogs, and occasionally on shores (but still isolated from groundwater influence). Stands have a saturated hydrology with a fibric *Spaghnum* spp. peat soil and a pH usually < 4.3 (Harris *et al.* 1996, Minnesota DNR 1993).

CHARACTERISTIC SPECIES

Isle Royale National Park

Chamaedaphne calyculata, Ledum groenlandicum, Sphagnum spp.

Globally

Chamaedaphne calyculata, Ledum groenlandicum, Sphagnum spp.

VEGETATION DESCRIPTION

Isle Royale National Park

The leatherleaf bog is a peatland dominated by evergreen dwarf-shrubs. This community may have a few scattered trees, with canopy cover from 0 to 20%. The common trees are *Picea mariana* and *Larix laricina*. There may be a few tall shrubs with 0 to 5% cover, these are mainly stunted, scrub forms of *Larix laricina*, *Picea mariana*, and *Thuja occidentalis*. The short shrub layer (less than 1 m tall, including dwarf shrubs) varies from 40 to 70% cover; the most abundant shrubs are *Chamaedaphne calyculata* (25 to 50% cover), *Ledum groenlandicum* (5 to 25% cover), *Alnus incana*, *Andromeda*

USGS-NPS Vegetation Mapping Program Isle Royale National Park

polifolia var. glaucophylla, Kalmia polifolia, and Vaccinium oxycoccos (each with 1 to 5% cover). Cover of herbs varies from 10 to 60%; the most common herbs are Carex oligosperma, Carex lasiocarpa, Drosera rotundifolia, and Sarracenia purpurea. There is a nearly continuous mat of peat mosses, with 80 to 100% cover of Sphagnum spp.

Globally

Vegetation is dominated by an open dwarf-shrub/scrub conifer layer with very scattered trees (<10% cover). Microtopography is high hummocks with weakly developing hollows. Ericaceous dwarf-shrubs are dominant, including Chamaedaphne calyculata, Kalmia polifolia, and Ledum groenlandicum, and the creeping dwarf-shrubs Andromeda polifolia and Vaccinium oxycoccos. Scrub conifers include Larix laricina and Picea mariana. They also occur as scattered trees (> 3m). The herb layer is species poor, containing Carex oligosperma, Carex pauciflora, Eriophorum vaginatum, and Sarracenia purpurea. The moss layer forms a continuous hummocky mat dominated by Sphagnum angustifolium, Sphagnum fuscum, and Sphagnum magellanicum (Minnesota NHP 1993, Harris et al. 1996). Diagnostic features of this type include the dominance of a dwarf-shrub ericaceous layer, absence of a tree layer (<10%), species-poor herbaceous layer, and almost complete lack of minerotrophic indicators, such as Betula pumila, Carex aquatilis, and Carex stricta. A possible subtype may occur where pools form near the bog crests, and contain maritime species such as Scheucherzia palustris, Rhynchospora alba, Sphagnum cuspidatum, and Utricularia cornata.

RANGE

Isle Royale National Park

This community is an uncommon community that is scattered around the island near the Lake Superior shore.

Globally

This association is found in Minnesota, Wisconsin, Michigan, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions along the Lake Superior shore where water levels are influenced by lake processes.

Globally

This community is typically found on floating mats on the edges of lakes and streams, with localized shallow surface pools that may persist throughout the growing season. Stands occur where there is low wave and current energy with seasonal flooding; the water regime is otherwise saturated (Harris *et al.* 1996).

Globally

Myrica gale, Chamaedaphne calyculata, Carex lasiocarpa

VEGETATION DESCRIPTION

Isle Royale National Park

This leatherleaf - sweet gale shore fen is a peatland with a mixture of broad-leaved evergreen and deciduous shrubs and sedges. It often occurs as a floating mat. Cover of short shrubs (under 1 m tall, including dwarf shrubs) usually varies from 50 to 80%; the most abundant shrubs are *Myrica gale* (25 to 50% cover), *Chamaedaphne calyculata* (5 to 50% cover), *Andromeda polifolia* var. *glaucophylla* (1 to 10% cover), *Vaccinium oxycoccos*, and *V. macrocarpon* (each 0 to 5% cover). Scattered stunted trees and tall shrubs may be present (with 0 to 5% cover); most common are *Larix laricina* and *Picea mariana*. Cover of herbs varies from 50 to 80%; the most abundant herb is *Carex lasiocarpa*. Cover of mosses varies from 0 to 90%; the most abundant mosses are *Sphagnum* spp.

Globally

Isle Royale National Park

Low shrubs dominate the stands, generally over 60% cover. Dominant species include Chamaedaphne calyculata and Myrica gale. Salix pedicillaris is often present. The herbaceous layer is variable in cover and composition, sometimes shaded out by the heavy shrub cover. Species include Calamagrostis canadensis, Carex aquatilis, Carex lasiocarpa, Carex rostrata, and Potentilla palustris (Harris et al. 1996). In northern Minnesota a short shrub layer with low to moderate cover is often present, with Myrica gale, Betula glandulifera, Alnus incana, Salix petiolaris, and Salix pedicellaris the most abundant shrubs. In the dwarf-shrub layer Chamaedaphne calyculata is usually present at 80-100% cover but may be mixed with lesser amounts of Andromeda glaucophylla and Vaccinium oxycoccos. In addition to bog plants such as Eriophorum spissum and Drosera rotundifolia, other minerotrophic indicators are also present at 10-40% cover. These include Carex lacustris, Carex lasiocarpa, Typha latifolia, Calamagrostis canadensis, and Iris versicolor. Occasionally, herbaceous cover may reach 90%. A continuous carpet of peat moss includes species such as Sphagnum magellanicum, Sphagnum recurvum sensu stricta, Sphagnum angustifolium, and Sphagnum subsecundum sensu lato (M. Smith personal communication 1999).

RANGE

Isle Royale National Park

This community is restricted to rocky summits and rocky slopes of ridges where a lot of bedrock is exposed; it is scattered throughout the park.

Globally

This association is found in Michigan and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

At Isle Royale National Park, this community occupies sites on well-drained rocky ridges and slopes; usually there is a lot of exposed bedrock.

Globally

Stands occur on granite or metamorphic rocks. Soils are thin and acidic. Conditions at Isle Royale National Park, where this community is restricted to rocky summits and rocky slopes of ridges where a lot of bedrock is exposed, may be typical of the type (C. Reschke 1999). It may also occur on disturbed sites, following clearing of the natural vegetation (M. Smith personal communication).

Isle Royale National Park

This community is uncommon and widely scattered throughout the park.

Globally

This association is widespread in the Northeast, mid-Atlantic, and northern Midwest regions of the United States. It also can be found in Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions or alluvial flats at elevations of 605 to 820 feet. Slopes vary from flat to gentle. Soils are usually very poorly drained peats or mucks that are saturated to seasonally flooded.

Globally

Stands occur on the floodplains of small streams, in poorly drained depressions, beaver meadows, and lakeshores. Soils are typically mineral soil or well-decomposed peat, with a thick root mat (Harris *et al.* 1996). In northern Minnesota, the water regime varies between temporarily and seasonally flooded (M. Smith personal communication 1999).

RANGE

Isle Royale National Park

This community is uncommon, and widely scattered through the park.

Globally

This association is found in North Dakota, South Dakota, Minnesota, Iowa, Wisconsin, Michigan, Ontario, Manitoba, and possible Maine.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions and alluvial flats, at elevations ranging from 610 to 670 feet. Slopes are flat to gentle. Soils are very poorly drained mucks or peats that are saturated to permanently flooded.

Globally

Sites are found on floodplains, shallow bays of lakes and streams, beaver meadows, ditches, and occasionally in isolated basins, or on semi-floating mats. Hydrology is seasonally to semipermanently flooded. Substrate is mineral soil or well-decomposed peat (Curtis 1959, Harris *et al.* 1996). Standing dead trees, especially in beaver meadows, are common. Hummock and hollow microtopography is usually well developed, with standing water often in the hollows. The water regime is highly variable, ranging from saturated to permanently flooded (M. Smith personal communication 1999).

MOST ABUNDANT SPECIES

Forb Eupatorium maculatum

CHARACTERISTIC SPECIES

Isle Royale National Park

Carex rostrata, Carex stricta

Globally

Carex rostrata, Carex lacustris, Carex vesicaria

VEGETATION DESCRIPTION

Isle Royale National Park

This wet meadow is a wetland dominated by sedges. *Carex rostrata* is the most abundant sedge (average 75% cover), *Carex stricta* is also common (average 18% cover); other characteristic herbs are *Scirpus cyperinus*, *Lycopus americanus* and *Sium suave*; *Myrica gale* is the most common shrub (< 5% cover).

Globally

Tall coarse-leaved sedges dominate the vegetation layer, often creating a tussocky hummock microtopography. Shrubs can cover up to 25% of the area. Pools with submergents may also be present. Dominant graminoids include a number of carices, including *Carex aquatilis, Carex lacustris, Carex lasiocarpa, Carex rostrata, Carex vesicaria*, and locally *Carex stricta*. Other graminoids include *Calamagrostis canadensis, Scirpus atrovirens, Scirpus cyperinus*, and, in wetter areas, *Eleocharis smallii* and *Equisetum fluviatile*. Forbs include *Acorus calamus, Aster simplex, Campanula aparinoides, Eupatorium maculatum, Iris shrevei, Lycopus uniflorus, Poa palustris, Polygonum amphibium, Potentilla palustris*, and others (Curtis 1959, Harris *et al.* 1996). Stands with standing water or water channels running through them may contain species typical of wetter conditions such as *Brasenia schreberii* or *Potamogeton* spp. In most circumstances, the moss layer is virtually absent. In the uncommon cases where sedges are colonizing a peatland, however, the moss strata can be 20-90% cover of *Sphagnum* spp. (M. Smith personal communication 1999).

Cladium mariscoides

Globally

Cladium mariscoides

VEGETATION DESCRIPTION

Isle Royale National Park

This twig rush wet meadow is a wetland dominated by sedges. *Cladium mariscoides* is the most abundant herb (average 62% cover), other common herbs are *Carex lacustris*, *Rhynchospora alba*, and *Utricularia intermedia* (each < 25% cover); *Myrica gale* is the most abundant shrub (<25% cover); *Sphagnum* spp. are very common in the groundlayer (average 37% cover).

Globally

The vegetation is dominated by graminoids. Stands in northwest Ohio, and possibly adjacent states, contain *Cladium mariscoides, Carex cryptolepis, Juncus canadensis*, and *Rhynchospora alba* (G. Schneider personal communication 1996). This twig rush wet meadow is a wetland dominated by sedges. *Cladium mariscoides* is the most abundant herb (average 62%).

Isle Royale National Park

cover), other common herbs are *Carex lacustris, Rhynchospora alba*, and *Utricularia intermedia* (each < 25% cover); *Myrica gale* is the most abundant shrub (<25% cover); *Sphagnum* spp. are very common in the groundlayer (average 37% cover) (C. Reschke personal communication1999).

OTHER NOTEWORTHY SPECIES

Isle Royale National Park

Information not available.

CONSERVATION RANK G3G5. There are probably close to 100 occurrences of this community in the Great Lakes basin. It is reported from Ohio (where it is ranked S4), Indiana (S1), and Ontario (S?). Similar vegetation occurs along the Lake Ontario shores in New York. Currently there are two occurrences documented in Indiana. There are probably at least 1000 acres of this community rangewide. Currently 75 acres are documented from one occurrence in Indiana. Many wetlands along the Great Lakes shores have been disturbed by shoreline development and alterations to hydrology, including alterations to lake level fluctuations.

RANGE

Isle Royale National Park

This community is rare; it was only sampled at one site during 1997 surveys, at Brady Cove. There are probably a few other widely scattered sites in well-protected, quiet bays of Lake Superior.

Globally

This association is found in Michigan, Minnesota, Wisconsin, New York, and Ontario. It may have been eliminated from its range in Ohio.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies shallow water of a bay or cove of Lake Superior, subject to fluctuating water levels from the lake's seiche. Soils are permanently flooded sands.

Globally

Storms, seiches, and water level cycles contribute to a dynamic vegetation structure and composition. Substrate is mineral soil. Water depth generally exceeds 0.3 m (Minc 1997).

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM PALUSTRINE

RANGE

Isle Royale National Park

This community is uncommon, and scattered mainly on interior lakes; it may also occur on very protected, quiet bays of Lake Superior.

Globally

This community was once widespread in depressions or swales of riverine systems and shallow water zones in swamps, ponds, lakes, and streams throughout the midwestern United States. It is currently found in Minnesota, Iowa, Wisconsin, Ontario, Michigan, Ohio, Indiana, Illinois, Missouri, and probably Kentucky. Many of the presettlement occurrences of this community has been drained and converted to cropland or destroyed by siltation. Siltation greatly accelerates the natural transition of this habitat type as it succeeds from shallow inundation to moist soil.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies a narrow fringe zone in shallow water of lake beds, on flat to gentle slopes, at elevations ranging from 605 to 700 feet. Soils are usually permanently flooded sands or mucks; occasionally soils may be only seasonally flooded.

Globally

These highly productive wetlands are found in glacial potholes, river valleys, ponds, and on lake plains. They are characterized by continuous inundation and are considered a deep marsh. Water depth averages 0.3 - 0.6 m, ranging from several centimeters to more than one meter for a significant part of the growing season. Seasonal flooding during winter and spring or flooding during heavy rains help maintain these marshes by causing water exchange which replenishes freshwater and circulates nutrients and organic debris. Soils can be mineral or organic but are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper part. Vegetative diversity and density is highly variable in response to water depth, water chemistry, and natural forces. Periods of excessive flooding can occur in the winter and spring.

CHARACTERISTIC SPECIES

Isle Royale National Park

Scirpus acutus, Eleocharis smallii

Globally

Scirpus acutus, Typha latifolia

VEGETATION DESCRIPTION

Isle Royale National Park

This emergent marsh wetland community is dominated by bulrushes and spikerushes. *Scirpus acutus* is the most abundant emergent aquatic plant (average 22% cover); *Eleocharis smallii* is a common associate with a low cover (average < 2% cover); *Typha* spp. are very rare or absent from this community on Isle Royale, probably an effect of moose browsing.

Globally

This deepwater emergent marsh community is dominated by perennial herbaceous vegetation with graminoid leaves. A typical example of this marsh contains a mosaic of emergents, submergents, and floating plants interspersed with areas of open water (Harris *et al.* 1996). Various kinds of emergents may dominate a marsh depending on the water depth. Quite often the vegetation arranges itself in belts (wetland zonation), with a particular species or range of species occupying specific depths from the shoreline to deep open water. Marshes may display areas of open water, but vegetation dominates (>30 percent cover). *Typha latifolia*, *Typha angustifolia*, *Scirpus fluviatilis* and *Scirpus acutus* dominate this dynamic ecosystem. Sedges are also common (*Carex lupuliformis*, *Carex hyalinolepis*). A diverse assemblage of grasses, floating leaved aquatics, and submerged aquatics are present.

OTHER NOTEWORTHY SPECIES

Isle Royale National Park

Information not available.

Globally

Lythrum salicaria, Scirpus californicus

CONSERVATION RANK G5.

DATABASE CODE CEGL002229

MAP UNITS 46

COMMENTS

Globally

Emergent marshes exhibit differences in vegetative composition and physiognomy in response to water depth and substrate aggradation. In Ohio, *Scirpus validus* is most common and *Scirpus acutus* is rare (it is more common in OH fens). Seasonal flooding and heavy rains influence vegetative growth, aquatic animals, and nutrient cycling in marsh ecosystems.

RANGE

Isle Royale National Park

This community is rare and scattered in the central to northeast portions of the park.

Globally

This association is found in North Dakota, Minnesota, Iowa, Wisconsin, Michigan, Illinois, Manitoba, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions at elevations ranging from 650 to 740 feet. Soils are very poorly drained peats that are saturated.

Globally

Stands are found in peatlands with low exposure to mineral-rich groundwater, including basin fens, shores above the level of seasonal flooding and larger peatlands. Water hydrology is saturated (Harris *et al.* 1996). The surface water is slightly acidic (pH 4.1-5.9) and nutrient poor [calcium < 13 mg/l) (MN NHP 1993).

Carex lasiocarpa, Carex chordorrhiza, Carex limosa, Carex oligosperma, Rhynchospora alba, Scirpus cespitosus, Sphagnum spp.

VEGETATION DESCRIPTION

Isle Royale National Park

This poor fen is a peatland dominated by sedges and peat moss. Carex oligosperma is the most abundant sedge (over 50% cover), other common herbs are Calamagrostis canadensis and Campanula aparinoides (each with < 25% cover); other characteristic herbs are Drosera rotundifolia, Iris versicolor, Platanthera psycodes, Dulichium arundinaceum, and Comarum palustre (= Potentilla palustris); the most abundant shrub is Chamaedaphne calyculata (< 25% cover); Sphagnum spp. are very common in the groundlayer (average 37% cover).

Globally

Isle Royale National Park

The vegetation is dominated by graminoids, with up to 25% shrub cover, and scattered trees. The dominant graminoid is Carex lasiocarpa, and typical associates include Carex chordorrhiza, Carex limosa, Carex oligosperma, Rhynchospora alba, Scirpus cespitosus, and Scheuchzeria palustris. Forbs include Sarracenia purpurea. The low shrub layer contains Andromeda polifolia, Betula pumila, Chamaedaphne calyculata, Larix laricina, Salix discolor, Salix pedicillaris, and Vaccinium oxycoccos. The moss layer is virtually continuous, and is dominated by Sphagnum capillifolium, Sphagnum fuscum, and Sphagnum magellanicum (Chapman et al. 1989, MN NHP 1993, Harris et al. 1996).

RANGE

Isle Royale National Park

This community is uncommon, and widely scattered throughout the park.

Globally

This community is reported from northern Minnesota, Manitoba, and northern Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies wet depressions at elevations from 601 to 770 feet. Soils are very poorly drained peats, sands, or mucks that are saturated to permanently flooded.

Globally

Stands occur on shallow or deep peaty soils in areas of calcareous discharge. The surface water may be circumneutral (pH 6.8 - 8.0), with high concentrations of dissolved salts that often form a marl precipitate. The discharge water is low in oxygen, which is believed to be important in inhibiting dense vegetation growth, and favoring heliophytic vascular and moss species (Minnesota NHP 1993).

Globally

Eleocharis smallii, Equisetum fluviatile, Sparganium fluctuans

VEGETATION DESCRIPTION

Isle Royale National Park

This emegent marsh community is a sparsely vegetated (<25% cover) wetland dominated by graminoid plants. *Eleocharis smallii* (average 9% cover) and *Equisetum fluviatile* (average 4% cover) are the most abundant emergent aquatic plants; *Sparganium fluctuans* is a common floating-leaved aquatic plant (average < 2% cover), and algae are the most common submerged aquatic plants.

Globally

Emergent cover is typically greater than 25%, and floating-leaved and submergent cover is low. Emergent graminoids < 1 m dominate the stands, including *Equisetum fluviatile* and/or *Eleocharis smallii*. Associated species of low constancy include *Glyceria borealis, Isoetes echinospora, Potamogeton gramineus*, and *Utricularia vulgaris* (Harris *et al.* 1996). In northern

Isle Royale National Park

Minnesota, stands most commonly have a mix of Equisetum fluviatile and Acorus calamus. Acorus calamus may also mix with Sagittaria rigida and, less commonly, Sparganium chlorocarpum. Other herbs that may be present but are not dominant include Cicuta bulbifera, Polygonum lapathifolium, Sium Suave, and Sparganium fluctuans. Aquatic species may also be present at low density and include Potamogeton spp., Utricularia intermedia, and Najas flexilis (M. Smith personal communication 1999).

RANGE

Isle Royale National Park

This community is common in interior lakes, and occasionally occurs on very protected, quiet water bays of Lake Superior.

Globally

This associations is found in North Dakota, South Dakota, Minnesota, Iowa, Wisconsin, Michigan, Illinois, Indiana, Ohio, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies permanently flooded lake beds with substrates of sand, muck, or clay. This is a submerged aquatic community; nearly all the vegetation is under water.

Globally

The major environmental controls on submerged aquatic vegetation, as noted by Curtis (1959), are water depth (as it relates to light intensity), water chemistry, water movement, and nature of the substrate. Various combinations of these factors can interact in a variety of ways to influence the local composition of the community. As a result, a single lake may contain a number of relatively homogeneous stands, each with a different species makeup, depending on depth, nature of adjoining shoreline, degree of protection from waves, etc. Water chemistry may be one of the few constants. Assessment of water conductivity and alkalinity are two measured parameters that can provide some understanding of the influence of water chemistry on species composition. Curtis (1959) also summarizes a study by Swindale and Curtis (1959).

CHARACTERISTIC SPECIES

Isle Royale National Park

Chara spp., Utricularia spp., Potamogeton spp., Sparganium fluctuans

Globally

Potamogeton spp., Ceratophyllum spp., Myriophyllum spp., Chara spp., Utricularia spp.

VEGETATION DESCRIPTION

Isle Royale National Park

At Isle Royale NP, Midwest pondweed submerged aquatic wetland is a deepwater wetland dominated by submerged aquatic vegetation. The most abundant vegetation consists of submerged aquatics such as *Chara* spp., algae, *Utricularia*

Isle Royale National Park

spp., and *Potamogeton* spp.; *Sparganium fluctuans* is a common floating leaved aquatic plant (average 10 % cover); *Eleocharis smallii* and *Equisetum fluviatile* are the most abundant emergent aquatic plants (each averaging < 5% cover).

Globally

Based on information in the northern parts of the Midwest, several vegetation subgroups can be recognized that may be separate associations. Subgroup A is a shallow (<50 cm), sparsely vegetated, open water marsh found on sand, or organic and mineral material trapped in rocky bottoms. Stands are often exposed to wave action and found in oligotrophic lakes. Dominant plants often have basal rosettes that are resistant to wave action. Typical species include Elatine minima, Eriocaulon aquaticum, Gratiola aurea, Isoetes echinospora, Isoetes macrospora, Juncus pelocarpus, and Lobelia dortmanna (Curtis 1959, Harris et al. 1996). Subgroup B is a shallow (<50 cm) open water marsh with emergent cover <25% and floating-leaved aquatics >25%. Substrate is a mineral soil (often sand), boulders, or a mixture of sedimentary peat and fine mineral soil. Stands can be exposed to waves or are in stream channels. Stands may often be dominated by a single species. Typical dominants include Eleocharis acicularis, Myriopyllum spp., Potamogeton amplifolius, Potamogeton gramineus, Potamogeton praelongus, Potamogeton robbinsii, Sparganium fluctuans, and Utricularia vulgaris. Subgroup C includes open water marsh with emergent cover < 25% and floating leaved aquatics >25%. Substrate is sedimentary peat and stands are often found in sheltered bays of lakes and streams which do not have high wave energy. Stands may often be dominated by a single species. Typical dominants include Ceratophyllum demersum, Lemna spp., Myriophyllum sibiricum, Myriophyllum verticillatum, Potamogeton natans, Potamogeton pectinatus, Potamogeton richardsonii, Potamogeton zosteriformis, Ranunculus aquatilis, Utricularia vulgaris, and Vallisneria americana (Curtis 1959, Harris et al. 1996).

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies quiet waters of interior lakes. It may also occur on very protected, quiet bays of Lake Superior (however none were reported on Lake Superior in 1997 or 1998 surveys). The interior lakes occur at elevations ranging from 660 to 987 feet; substrates are permanently flooded mucks.

Globally

Stands occur in open, slow-moving water on lakes and streams, often less than 0.5 m deep. The substrate is variable, from muck to sedimentary peat (Harris et al. 1996).

MOST ABUNDANT SPECIES

Isle Royale National Park

<u>Stratum</u> <u>Species</u>

Floating-leaved Potamogeton spp., Nuphar lutea ssp. variegata, Nymphaea odorata

Globally

<u>Stratum</u> <u>Species</u>

Floating-leaved Nuphar lutea ssp. variegata, Nuphar lutea ssp. pumila, Nymphaea odorata, Potamogeton spp.

CHARACTERISTIC SPECIES

Isle Royale National Park

Nuphar lutea ssp. variegata, Nymphaea odorata

Globally

Nuphar lutea ssp. variegata, Nuphar lutea ssp. pumila, Nymphaea odorata, Potamogeton spp.

VEGETATION DESCRIPTION

Isle Royale National Park

At Isle Royale NP, northern water lily aquatic wetland is a sparsely vegetated deepwater wetland dominated by floating-leaved and submerged aquatic vegetation. *Potamogeton* spp. are the most abundant herbs (average < 5% cover); *Nuphar lutea* ssp. *variegata* and *Nymphaea odorata* are the most abundant floating-leaved aquatic plants (each averages < 1 % cover).

Globally

Emergent vegetation cover is less than 25% and floating-leaved aquatics cover at least 25% of the surface. Typical dominants vary from stand to stand, but include *Nymphaea odorata*, *Nuphar lutea ssp. pumila*, and *Nuphar lutea ssp. variegata*. Other dominants may include *Brasenia schreberi* and *Potamogeton amplifolius*. A variety of emergent species can occur with this type (Harris *et al.* 1996).

ALLIANCE OPEN BLUFF/CLIFF SPARSELY VEGETATED ALLIANCE

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is uncommon; it is mostly found on ridges near the northwest shore of the park, and it also occurs along the shoreline cliffs on the northwest shore.

Globally

This associations is found in Minnesota, Wisconsin, Michigan, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies very steeply sloping cliffs where the exposed bedrock is basalt, usually at elevations ranging from 605 to 705 feet.

Globally

This community occurs on vertical or near-vertical, south- to west-facing aspects of basalt or diabase bedrock. In Michigan cliffs range from only 3 - 6 m to over 60 m tall (Albert *et al.* 1995). Moisture is derived from precipitation. Cliffs along the Great Lakes shore are exposed to severe wave action, preventing establishment of vegetation.

MOST ABUNDANT SPECIES

Isle Royale National Park

<u>Stratum</u> <u>Species</u>

Shrub Pinus strobus, Picea glauca, Alnus viridis Fern Woodsia ilvensis, Polypodium virginianum

Globally

Cladonia spp., Woodsia ilvensis, Polypodium virginianum, Deschampsia flexuosa

VEGETATION DESCRIPTION

Isle Royale National Park

This basalt cliff type is sparsely vegetated. Crustose and foliose lichens and mosses are very common: characteristic lichens (average 40% cover) include *Cladonia* spp., *Xanthoparmelia* spp., *Umbilicaria deusta, Lobaria pulmonaria, Parmelia* spp., and *Rhizocarpon* spp. Characteristic mosses (average 30% cover) are *Schistidium* spp. and *Pleurozium schreberi*. The most abundant herbs are *Woodsia ilvensis, Polypodium virginianum*, and *Deschampsia flexuosa*. The most abundant trees and shrubs are *Pinus strobus* (average 5% cover), *Picea glauca*, and *Alnus viridis* (each with < 2% cover).

Isle Royale National Park

Globally

Vegetation is often sparse, due to severe wave action. Mosses, lichens, ferns, and liverworts may be found, with occasional graminoids in crevices or shelves that trap soil. In Minnesota, arctic-alpine disjunct plant species (e.g., *Arenaria macrophylla, Draba norvegica*) and more temperate plant species may be found (Minnesota nhp 1993, Albert *et al.* 1995). At Isle Royale NP, crustose and foliose lichens and mosses are very common. Characteristic lichens (average 40% cover) include *Cladonia* spp., *Xanthoparmelia* spp., *Umbilicaria deusta, Lobaria pulmonaria, Parmelia* spp., and *Rhizocarpon* spp. Characteristic mosses (average 30% cover) are *Schistidium* spp. and *Pleurozium schreberi*. The most abundant herbs are *Woodsia ilvensis, Polypodium virginianum*, and *Deschampsia flexuosa*. The most abundant trees and shrubs are *Pinus strobus* (average 5% cover), *Picea glauca*, and *Alnus viridis* (each with < 2% cover) (C. Reschke personal communication 1999).

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM TERRESTRIAL

RANGE

Isle Royale National Park

This community is uncommon; it occurs primarily along the southeast shores of Isle Royale, with a few widely scattered sites along the northwest shore on peninsulas, islands, or coves that are exposed on their east, southeast, or south sides to wave wash and ice scour.

Globally

This associations is found in Michigan, Minnesota, and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies rugged, rocky shores of Lake Superior where the exposed bedrock is basalt, sandstone, or conglomerate that has a gentle to somewhat steep, usually southeast- (or south- or east-) facing slope. Elevations range from lake level to about 620 feet. This community is restricted to shores most exposed to wave wash and ice-scour, and does not occur in protected bays or harbors.

Globally

The bedrock consists of basalts, volcanic conglomerates, and localized rhyolites. Volcanic conglomerate shores may be more species rich than basalt shores due to the presence of cracks or small cavities in the former. Wave action and ice scour action exert a strong influence on the vegetation, producing a wave-washed zone almost devoid of vegetation near the shore, and scattered patches of vegetation further above the lakeshore (Albert *et al.* 1995).

MOST ABUNDANT SPECIES

Isle Royale National Park

<u>Stratum</u> <u>Species</u>

VEGETATION DESCRIPTION

Isle Royale National Park

At Isle Royale NP, Great Lakes basalt (conglomerate) bedrock lakeshore is a sparsely vegetated community dominated

Isle Royale National Park

by lichens and mosses. Crustose and foliose lichens are common to abundant (average 25 - 50% cover); characteristic nonvascular plants are the lichens Xanthoparmelia spp., Xanthoria elegans, Rhizocarpon geographicum and other Rhizocarpon spp., Acarospora spp. and Lecanora muralis, and Schistidium mosses; the most abundant herb is Sibbaldiopsis tridentata (= Potentilla tridentata) (average 2% cover), other characteristic herbs of dry rocks are Oligoneuron album (= Solidago ptarmicoides), Campanula rotundifolia, Carex umbellata, and Achillea millefolium; woody plants consist of dwarf forms of tree and shrub species, mostly under 1 m tall; characteristic woody plants of dry rocks are Physocarpus opulifolius, Pentaphylloides floribunda (= Potentilla fruticosa), Juniperus horizontalis, Thuja occidentalis, and Arctostaphylos uva-ursi; in areas where seepage keeps rocks moist, or fills rock pools and allows miniature perched meadows to develop on the rock, characteristic herbs are Scirpus cespitosus, Primula mistassinica, Castilleja septentrionalis, and Tofieldia glutinosa.

Globally

Wave action and ice scour action are strongest near the shore, producing a wave-washed zone almost devoid of vegetation, except for scattered patches of mosses and lichens, and pockets of herbaceous species around bedrock pools. Crustose and foliose lichens are common to abundant (average 25 - 50% cover). On Isle Royale, characteristic nonvascular plants are the lichens *Xanthoparmelia* spp., *Xanthoria elegans*, *Rhizocarpon geographicum* and other *Rhizocarpon* spp., *Acarospora* spp. and *Lecanora muralis*, and *Schistidium* mosses (C. Reschke personal communication 1999). With increasing distance above the lake, herbaceous and nonvascular plant cover increases, though still very patchy, with lichens predominating, particularly on high, dry rocks. Herbaceous species include *Achillea millefolium*, *Campanula rotundifolia*, *Fragaria virginiana*, *Sibbaldiopsis tridentata* (=Potentilla tridentata), and *Solidago simplex*. Perched meadows, dominated by tufted graminoids, are found at the edge of seasonal pools. The most common meadow species are *Calamagrostis canadensis*, *Carex buxbaumii*, *Carex castanea*, *Danthonia spicata*, *Deschampsia cespitosa*, *Scirpus cespitosus*, and *Trisetum spicatum*, as well as *Pinguicula vulgaris*. Lichens, mosses, and liverworts are prominent. Scattered, often stunted, woody trees and shrubs are found throughout, including *Abies balsamea*, *Amelanchier* spp., *Juniperus communis*, *Picea glauca*, *Populus tremuloides*, *Rubus pubescens*, *Shepherdia canadensis*, *Thuja occidentalis*, and *Vaccinium angustifolium* (Albert et al. 1995).

COMMENTS

Isle Royale National Park

Globally

Wave action and ice scour action are the primary disturbances affecting the vegetation. Near the lakeshore a wave-washed zone is almost devoid of vegetation. A gradient of increasing vegetation occurs further above the lakeshore (Albert *et al.* 1995).

RANGE

Isle Royale National Park

This community is uncommon, mostly occurring at the southwest end of the park in gently curving, exposed bays of Lake Superior, in areas underlain by sandstone and conglomerate bedrock; it also occurs occasionally on shores underlain by basalt at the central and northeast portion of the park.

Globally

This associations is found in Michigan and Ontario.

ENVIRONMENTAL DESCRIPTION

Isle Royale National Park

This community occupies cobble or gravel shores of Lake Superior. These shores occur in coves and gently curving bays between rocky points. These are exposed shores that are regularly disturbed by wave action and winter ice movements, at elevations from lake level to about 608 feet. Most of the shore has little or no vegetation, probably due to regular disturbance by waves washing the shore. There is a shrub zone that occurs on the highest beach ridge, which is usually nearly level. This high beach ridge is formed by the most severe storm waves, so the disturbance is irregular and infrequent. There may be little or no soil; the plants are rooted in the cobble or gravel.
